II. Technically:

1. *Arch.*: The central solid portion or core of a twisted column.

2. *Anatol.*:

(1) *Human*: The central organ of circulation, inclosed in a membrane, the pericardium, and lying between the two layers of pleura, the mediastinum, with the base directed upward and backward to the right shoulder, and the apex downward and forward between the fifth and sixth ribs, and to the left. The under side is flattened and rests on the diaphragm, the upper rounded and convex, formed by the right ventricle and partially by the left; above these are the auricles whose appendages project forward, overlapping the root of the pulmonary artery, the large anterior vessel at the root of the heart, crossing obliquely the commencement of the aorta (a). The right is the venous side of the heart, the left arterial. (CIRCULATION.) The right auricle (A) is larger than the left, and more complex in structure; it has two valves, the eustachian and the coronary. There is not the same pyramidal form in the left ventricle as in the right; the apex of the heart is also the apex of the left ventricle, and therefore larger than the right. The valves of the right ventricle (v) are the tricuspid (b) and semilunar; of the left the mitral (bicuspid) and semilunar. The auriculo-ventricular opening connects the auricles and ventricles, and in connection with the ventricular valves we have the *columnæ carneæ* (c), of which there are three sets, and the *chordæ tendineæ* (d). There are three layers of fibers in the ventricles—the external, middle, and internal—their peculiar spiral arrangement causing the tilting forward of the cardiac apex. The fibers of the auricles are in two layers—the external and internal; and the left auricle is thicker and more fleshy than the right. From the right ventricle arises the pulmonary artery, conveying the venous blood to be aerated in the lungs; the infundibulum is a prolongation of the anterior wall. The left auricle contains the four pulmonary veins returning the blood to the heart, thence to the left ventricle, and thence to the aorta, to be distributed to every part of the body, returning by the superior and inferior *vena cava* to the right auricle.

(2) *Compar.*: In the lowest animals we have no bloodvessels, every part absorbing nutritious fluid for itself; the lower Entozoa, and even the embryo in man in its early stage, are examples. The jelly-fish is the lowest form of life with circulatory vessels, and the higher Entozoa, then in the Sea-Urchin and Star-fish, we come to contractile power and pulsation in part of the chief vessel; and in the higher order of worms and in insects this is divided into cavities, until, in the mollusks, we come to a distinct sac, with muscular walls and two chambers—an auricle and ventricle—in fact, a systemic heart. Then in fishes we have a two-chambered heart, not commencing at systemic circulation, but at the origin of respiratory movement. Among the higher reptiles, we find the circulation approaching that in birds and mammals, till we get the double heart, as in man.

hëat, ***heate**, ***heet**, ***hete**, ***heete**, *s.* [A. S. *hæta*, *hæto*, from *hât*=hot; cogn. with Dan. *hede*, from *hed*=hot; Sw. *hetta*, from *het*=hot; Icel. *hiti*; Dut. *hitte*; Ger. *hitze*; O. H. Ger. *heizi*.]

I. Ordinary Language:

II. Technically:

1. Forging:

(1) The mass or piece of iron undergoing forging.

(2) A single exposure to the fire; as, to shape a horseshoe at a single *heat*.

2. Phys.: In natural philosophy the term *heat* is used chiefly to mean, not the sensation which our bodies feel when we say that they are hot, but the particular state or condition of matter which causes this sensation. Two hypotheses regarding *heat* have had advocates:

(1) *The Theory of Emission*: It supposes *heat* to be caused by a subtle imponderable fluid surrounding the molecules of bodies so as to envelop them in a "heat atmosphere." These have a repelling effect on each other, thus tending to loosen or even dissolve cohesion. [EMISSION.]

(2) *The Theory of Undulation*: Advocated by Melloni and others. It supposes that *heat* is caused by an oscillatory or vibratory motion of the particles of a body. It is thus a condition of matter and not a substance. The hottest bodies are those in which the vibrations move quickest through the widest space. This is now the accepted hypothesis. It is called also the *Mechanical or Dynamical Theory of Heat*. [UNDULATORY.]

Heat makes bodies, whether solid, liquid, or gaseous, expand, while cold contracts them. [EXPANSION.] Water is a partial exception to the rule. [WATER.] In the case of a solid, *heat* can produce fusion at a certain definite temperature; in that of liquids vaporization. It is transmitted by radiation (q. v.), or by conduction (q. v.). Radiant *heat* is that produced by radiation, and the expressions ray of *heat*, thermal ray, or calorific ray may be used so as to correspond to the terms ray of light and luminous ray. Latent *heat* is that which is absorbed by solid bodies when they are subjected to calorific influence far more than sufficient to make them melt, and when at the very time they are in process of fusion. The *heat* does not raise the temperature of the solid till it is completely liquefied. It was discovered by Black, who taught it, in A. D. 1762. There is also a latent *heat* of vaporization, being *heat* absorbed by liquids when being converted into vapor. Latent is opposed to sensible *heat*. *Heat* may be reflected or refracted [REFLECTION], or, by being irregularly reflected in all directions, it may become scattered or diffused *heat*; reflection and refraction may also polarize its rays, as happens to those of solar light. The *heat* which falls on a body is called incident *heat*. Specific *heat* is the quantity of *heat* required to raise the temperature of a

body of a given weight 1°; the unit of measure being the quantity required to raise the same weight of water to the same temperature. *Heat* may be produced by solar radiation, chemical action, friction, pressure, percussion, absorption, and imbibition; by the conduction of powerful magnets and bodies in motion, &c. When moderate it is measured by the thermometer (q. v.), when great by a pyrometer (q. v.). It is used as a force or agent in the steam-engine and many other machines. It has a mechanical equivalent. (*Ganot*, &c.)

3. *Racing*: A single course in a race or contest consisting of two or more separate contests.

¶ For the difference between *heat* and *fire*, see FIRE.

***heat-oppressed**, *a.* Feverishly excited, heated.

"Proceeding from the *heat-oppressed* brain."
Shakespeare: Macbeth, ii. 1.

heat-spectrum, *s.*

Physics: The spectrum of calorific rays. As a beam of light after passing through a prism is dispersed into a spectrum (q. v.) of visible colors, which differ in apparent brightness, so the perceptible warmth is also dispersed into a band, which differs in various regions in the amount of *heat* and the special qualities of that *heat*. The *heat* is greatest of all at the extreme end of, or just beyond the visible red. Modern science only recognizes waves of different lengths and periods, each of which is adapted to produce certain effects. Thus it is that the most powerful *heat*-waves are slower than the slowest visible waves.

heave-offering, *s.*

Judaism: The rendering of the Heb. word *terumah*=(f) an oblation, an offering, a gift, (2) a sacrifice consecrated by elevating it; *rum*=to elevate one's self. When Aaron was consecrated high priest, Moses and his coadjutors were enjoined to sanctify or set apart the shoulder of the ram used for the consecration, called the shoulder of the heave-offering, which was to be waved and heaved up. It thenceforth became Aaron's and his sons', as an offering by the Israelites from their peace offerings to Jehovah. Similar arrangements were to be carried out in all future time (Exod. xxix. 27, 28), and all heave-offerings were to belong to Aaron and his sons, with their legitimate successors (Num. xviii. 8, 19).

They were specially given in connection with peace offerings (Lev. vii. 11-14). Heave-offerings were to be given when the first bread of the land was consumed, and in connection with the produce of the threshing-floor (Num. xv. 19-21; cf. Deut. xii. 6). Even tithes were looked on as heave-offerings (xviii. 24); so was a share of the prisoners, animals, and other prey taken in war (xxxi. 28, 29, 41).

"Thou shalt offer a cake of the first of your dough for an heave-offering."—*Numbers* xv. 20.

heave-shoulder, *s.*

Judaism: The shoulder of the ram used in the consecration of Aaron, used as a heave-offering. [**HEAVE-OFFERING**.]

"So supper came up. And first a heave-shoulder and a wave-breast were set on the table before them."—*Bunyan: Pilgrim's Progress*, pt. ii.

heaven, **Heaven** (as *hēv'n*), **hef-en*, **heof-en*, **heof-ene*, **heov-en*, **hev-en*, **hev-ene*, *s.* [*A. S.* *heofon*, *hiðfon*, *hefon*; *O. Icel.* *hiðinn*; *O. Sax.* *hevan*.]

I. Ordinary Language:

1. *More or less literally (of the form heaven)*:

(1) The atmosphere surrounding the globe.

"And fowl that may fly above the earth in the open firmament of heaven."—*Genesis* i. 20.

(2) The region beyond the atmosphere, studded with stars.

"I will multiply thy seed as the stars of the heaven."—*Gen.* xxii. 17.

(3) The abode of God and the blessed. [II. 1.] With reference to the two foregoing meanings, this is sometimes called the heaven of heavens (Deut. x. 14; 1 Kings viii. 27), or the third heaven.

"Caught up to the third heaven."—2 Cor. xii. 2.

2. *More or less figuratively*:

(1) *Of the form heaven*:

(a) Any place considered as a supremely blessed one in which to live.

"Ere Douglasses to ruin driven,
Were exiled from their native heaven."

Scott: *Lady of the Lake*, ii. 8.

†(b) A person association with whom would, it is believed, cause the highest felicity.

"The heaven thou preaches or the heaven thou art."

Moore: *Veiled Prophet of Khorassan*.

(c) Love, viewed as the sweetest of felicity.

(d) Any social, intellectual, moral, or other elevation, sublimity of position, or of ascent.

"O, for a muse of fire, that would ascend
The brightest heaven of invention."

Shakespeare: *Henry V.* i. (Chorus.)

(2) *Of the form Heaven*:

(a) God.

"Heaven from above, and Conscience from within,
Cries in his startled ear—Abstain from sin!"

Cooper: *Progress of Error*, 47.

(b) The imaginary pagan divinities. In this sense often in the plural.

¶ The exclamation, *Heavens!* may have originally been an appeal in some moment of great excitement for aid to the heathen gods.

II. Technically:

1. *Theol.*: The place or state of the blessed.

(1) *Ethnic belief*: Heaven among the Greeks and Latins was regarded as the home of the greater gods, not as the abode of the just after death. In Hesiod there is a reference to the Islands of the Blest, where the heroes of the Fourth Age were to pass a second life. Afterward the Elysian Fields, by Pindar placed in the extreme west, though they often were thought to be beneath the earth, were supposed to be the home of the spirits of the just. In most of the ethnic beliefs, heaven, as a state, is a realization of the earthly *summum bonum*. There are three chief sites of the ethnic heaven: (1) Some distant part of this earth: The seats of happiness are represented by some Hindu writers to be vast mountains on the north of India; (2) below the earth, as many of the lower races still think; and (3) in the extreme west, an opinion with poetic beauty in its favor, since it is in that region the Sun descends to his home, the land where, according to the solar myths, there is no more night.

(2) *Jewish*: Many passages relate to heaven, or the heaven of heavens, as the special abode of God (1 Kings viii. 27) and very high (Job xxii. 12). With regard to man, the references in the Old Testament to a state of existence beyond the present are few; these few, however, assign joy and pleasure to the righteous (Psalm xvi. 10, 11), attended by resplendent glory (Dan. xii. 2, 3).

(3) *Christian*: The heaven of blessedness is spoken of as if its locality was upward from the earth (Luke xxiv. 51; John i. 32; Rev. xi. 12, xxi. 10). God, whom the disciples and Christians generally were taught to address as their Father, is there (Matt. v. 16, 45, 48; vi. 9); Christ came thence at first (1 Cor. xv. 47), and, when His mission to earth was complete, re-ascended thither (Luke xxiv. 51). The Holy Spirit was sent down from heaven (1 Peter i. 12); the throne of God is there (Rev. iv. 2; v. 1); nay, in one sense, all heaven is that throne (Matt. v. 34). Innumerable angels are in heaven, surrounding the Divine throne (Rev. v. 11); there is a temple also (Rev. xi. 19; xiv. 17; xvi. 17). Multitudes of persons, sealed as the servants of God, out of every nation, shall be there, clothed in white robes, and with palms in their hands (Rev. vii. 3, 9). They shall no more hunger or thirst, or feel undue heat or any sorrow (13-17). This felicity will not be reached till after the resurrection, when this corruptible shall put on incorruption, and this mortal immortality, death, the last enemy, being destroyed (1 Cor. xv. 26, 54).

2. *Symbolism*: Heaven, in the Table of Symbols of the early ages, is represented by the segment of a circle, sometimes of blue, or of the three colors of the rainbow; the universe by a globe of blue.

¶ *Host of Heaven*:

1. The stars.

"And when thou seest the sun, and the moon, and the stars, even all the host of heaven."—*Deut.* iv. 19.

2. Angels.

"I saw the Lord sitting on his throne, and all the host of heaven standing by him on his right hand and on his left."—1 Kings xxii. 19.

Shakespeare: *Two Gentlemen of Verona*, iii. 2.

heaven-bridge, *s.*

Compar. Relig.: A bridge, sometimes called the Bridge of Death, supposed to reach from this world to heaven, spanning the abyss of hell. Along this bridge the souls of the departed must travel: the good to pass over in safety, the wicked to fall into the abyss. It is spoken of under different names in the Zend-Avesta (*Sacred Books of the East*, iv. 213), in the Rabbinical literature (*Midrash*, *Yalkut Reubeni*, s. v. Gehinnom), and the Preliminary Discourse (§ iv.) to Sale's translation of the Koran. This bridge exists in the mythology of the Javanese, the Karens, the Bornese, the Greenlanders, and the Indians of North and South America. It has a place in the myth of Baldr; it lingers in the English song of "The Brig o' Dread"; and to this day the peasant of Nièvre tells of a little board,

"Pas pu longue, pas pu large
Qu'un ch'veu de la Sainte Vierge,"

put by St. John between the earth and Paradise.

"Among these people the *Heaven-bridge* is a sword; those who cross become men, those who dare not, women."—*Tylor: Early History of Mankind* (ed. 1878), p. 380.

From earth arrived at heaven-gate."

Milton: *P. L.*, x. 22.

heaven-gifted, *a.* Bestowed by heaven. (*Milton: Samson Agonistes*, 36.)

heaven-god, *s.*

Compar. Relig.: The sky personified and worshipped as the supreme deity. The heaven-god of the primitive Aryan was Dyaus, the bright sky, afterward Dyaus pitar, the Heaven father, consort of the Earth mother. The *Zeus pater* of the Greeks was credited with all celestial phenomena. A fragment from Sophocles (238)—which Plumptre translates:

"The air is Zeus, Zeus earth, and Zeus the heaven.
Zeus all that is, and what transcends them all"—

and one line of Ennius—

"Aspicis hoc sublime candens, quem omnes invocant
Jovem"

preserved for us in Cicero (*De Nat. Deor.*, iii. 4)—show that among the Greeks and Latins the heaven-god became later the god of heaven. Tylor (*Prim. Cult.*, ii. 231 sqq.) traces a similar development in the religion of the North American Indians, the Zulus, the tribes of Western Africa, the Tatar tribes; and among the Chinese Tien (Heaven) is in personal shape the Shang-ti, or Upper Emperor, the lord of the Universe.

"With such evidence perfectly accords the history of the *Heaven-god* among our Indo-European race."—*Tylor: Primitive Culture*, ii. 234.

heaven-guided, *a.* Guided or directed by the powers of heaven.

heaven-gulf, *s.*

Compar. Relig.: The same as the RIVER OF DEATH (q. v.).

"The *heaven-gulf* which has to be passed on the way to the Land of Spirits has a claim to careful discussion."—*Tylor: Early History of Mankind* (ed. 1878), p. 383.

heaven-tree, *s.*

Compar. Relig.: The mythic tree or vine which figures in many primitive beliefs as affording a means of ascent from the regions underground to the surface of the earth, or from the surface of the earth to the sky. Tylor says that variants of this myth have been found in the Malayan and Polynesian districts, in North and South America, in Borneo, the Celebes, and in New Zealand. In this country it survives in the nursery tale Jack and the Bean Stalk, which, strangely enough, is little known among cognate peoples.

"There was a heaven-tree where people went up and down, and when it fell it stretched some sixty miles."—*Tylor: Early History of Mankind* (3d ed.), p. 357. (Note.)

¶ (1) *Hebrew character:*

1. *Palaeography:* The character in which the Hebrew language is now written. This, called the square character, was not the earliest. The general opinion is that it came into use only in the centuries immediately preceding the birth of Christ, or even about the commencement of the Christian era itself. The character on the Maccabean coins is like the Samaritan, rather than the square Hebrew one. Gesenius, however, attributes the introduction of the square character to Ezra, and considers that the letters on coins were intentionally of archaic form. At first there were no vowel points. Those now existing were supplied by the Masorites about the seventh century of the Christian era.

(2) *Entom.:* A moth, *Tenebrionella gothica*, of the family Orthosidae. The "Hebrew character" on the wings is a black mark, like the figure 7 or a prostrate L.

2. *Hebrew Language:*

Philol.: The language spoken by the Hebrews (q. v.). Prof. Max Müller divides the Semitic "family" of languages into three "classes" or sub-families: Arabic or Southern, Hebraic or Middle, and Aramean or Northern. Under the second category he includes (1) Biblical Hebrew, (2) the Samaritan, as existing in the Samaritan Pentateuch, third century A. D.; (3) the Carthaginian or Phoenician of inscriptions. In the earliest books of the Old Testament it is already found in a high state of development. Only two periods of the language are traceable, a golden and a silver age. The latter was characterized by an increasing infusion of Aramean words and idioms. This process began with the rise of the Assyrian power; it advanced when the colonists were brought from the East to occupy the place of the ten tribes carried into exile; and it became yet more firmly established during the Babylonian captivity. During the exile the common people lost their native tongue, though the upper classes spoke it; and the Hebrew tongue of the New Testament (Acts xxii. 2) is Aramean.

¶ *Epistle to the Hebrews:*

Scrip. Canon: One of the most important epistles of the New Testament. Clement of Rome referred to it about A. D. 96, as did Justin Martyr in the

second century, followed in due time by many other Christian fathers. When the epistle was written, the temple worship seems still to have continued (v. 1-4, viii. 3, ix. 25, &c.), which would place its date earlier than A. D. 70, the year when Jerusalem was destroyed. Its author was not one of those who had heard Jesus, but belonged to the generation immediately succeeding (ii. 3). Who he was, is a question which has excited difference of opinion both in ancient and modern times. The Greek fathers generally attributed the epistle to St. Paul; the Latin Churches in Europe and Northern Africa were long of a different opinion, but by the commencement of the fourth century the Eastern view largely prevailed, in the West as well as in the East, and by the commencement of the fifth century it was everywhere dominant. Jerome and Augustine had much influence in giving it currency, which it retained to the Reformation. Erasmus, Cardinal Cajetan, Luther, Calvin, Beza, and others revived the old doubts. The Council of Trent gave a decision in favor of St. Paul, but in Protestant countries the question is still held to be a debatable one. Passages such as x. 34 and xiii. 23 might well have been written by St. Paul during his imprisonment in Rome, and there are a multitude of expressions in Hebrews like those of the epistles admitted to be St. Paul's. But, taken as a whole, the Greek composition is more finished and more rhetorical than that of the apostle. If Paul was not the author, who was? The early Church said Clement of Rome or St. Luke or Silas, called also Silvanus; Luther suggested Apollon, a much more probable opinion, which has since been ably defended in Germany by Semler, Bleek, De Wette, Tholuck, &c.

The "Hebrews" to whom the epistle was addressed were the Jewish converts to Christianity, specially those resident in Palestine, to whom Aramean was vernacular, though they knew Greek. Some fathers thought that the Greek epistle was translated from Aramean, but it has all the characteristics of an original writing. The Old Testament quotations are from the Septuagint, even where it differs from the Hebrew as if the author had not been familiar with the latter tongue. His treatment of types, symbols, &c., is suggestive of Philo and the Alexandrian writers, but this is not conclusive as to the epistle having been written in Egypt.

Its canonical authority was accepted in the early Church by many who denied its Pauline authorship. Eusebius places it among his *Homologoumena* (q. v.), and there has never been any impeachment of its integrity.

Internal evidence shows that the Palestinian Christians to whom it was addressed were in great danger of being seduced or persecuted again into the Judaism, which they had left (x. 32-39). The epistle was designed to keep them steadfast. It opens with arguments for the divinity of Christ and His consequent superiority to the angels. Hence Christianity bestowed through Him is superior to Judaism communicated by means of angels (i. ii. 1-3); He, a son, is superior to Moses, a servant (iii. 5, 6); His everlasting priesthood is superior to that of Aaron (vii.); His sacrifice was an effective one, of which those of Judaism were only types and shadows (ix.); Christianity was founded on the New Covenant, which was to abide, while the Old one decayed and was ready to vanish away (viii. 13). Let the converts hold fast to their Christian belief (ii. 1-3, x. 32-39), avoid apostasy (vi. 4-9), and imitate the ancient worthies, whose animating principle was faith (xi.), seeking for a "continuing city" in another world rather than in this (xiii. 14).

The heck-box slides vertically on a bar as the reel rotates, and thus disposes the warp spirally on the reel. The heck consists of a series of steel pins with eyes, through each of which one thread passes. The heck is in two parts, one a little raised from the other. The eyes of the parts being alternate, by raising one of them a little, the bands of the warp are separated; when the other part of the heck is raised, the position is reversed, the former upper band becoming the lower. This produces the lease, which is tied up, to form a guide for setting it in the loom.

[Gr. *hēdonikos*=pleasurable; *hoi hēdonikoi*=the voluptuaries—i. e., the followers of Aristippus.] Pertaining to Hedonism (q. v.)."The Hedonic doctrine of Aristippus."—Ueberweg: *Hist. of Philosophy*, i. 201.hē-dôn-ism, s. [Fr. *Hédonisme* (Litré), from Gr. *hēdonē*=delight, enjoyment; prop. of sensual pleasure.]

Anc. Philos.: The tenets of the Cyrenaic school of philosophy, founded by Aristippus, a disciple of Socrates. Aristotle calls him a Sophist, possibly because he demanded payment for his instruction. He taught that pleasure was the end of life, and that it was the duty of a wise man to enjoy pleasure without being controlled by it. This control was to be acquired by knowledge and culture. Horace, in one verse, tersely sums up the philosophy of Aristippus—

"Et mihi res, non me rebus, subjungere conor."

Epist. I. i. 18.

The most eminent of the Cyrenaic school were Arété, the daughter of the founder, her son, surnamed from her teaching Metrodidaktos, Theodoros the Atheist, and his scholars, Bio and Euhemerus. [EUPHEMERISM.] Anniceris the Younger sought to

ennoble the Hedonic principle by reckoning civil and social duties among the things which afford pleasure, yet he asserted that our efforts for the benefit of others should have an egoistic motive. Later the Cyrenaic doctrine gave way to Epicureanism. [EPICUREAN.]

Hë-gêl-ÿ-ân-ÿsm, *s.* [*Eng.*, &c., *Hegelian*; -*ism*.]

Philos.: The system outlined by George Frederick William Hegel (1770-1831) in his *Encyclopædie*. His teaching is in some degree a systematization of Schelling's ideas [*IDEALISM*, *SPINOZISM*], in their turn a development of those of Fichte. Michelet claims for Hegel the invention of a new method—the principle of the Identity of the Subject with the Object. Logic with Hegel is not an examination of the forms of thought, but of thoughts themselves, for whatever is true of the thought is true of the thing. Hegelianism deals with (1) Logic, (2) The Philosophy of Nature, (3) The Philosophy of the Intelligence. The whole system is contained in the Logic, of which the other parts are but an application. The first proposition is, Being and Non-Being are the same. This gives two contraries; there must be a relation to make them real. Unite them, and that is the Becoming. In this idea are two elements—a Non-Being from which it is evolving, and a Being which is evolved. Hegel claimed to be conservative and orthodox, and Baring Gould (*Origin of Relig. Belief* (ed. 1882), ii. 40) says that "if the modern intellect is to be reconciled to the dogma of the Incarnation, it will be through Hegel's discovery." On the other hand, the Young Hegelians—Strauss, Bruno Baur, Feuerbach, and others—assert that their doctrines, radical in politics and rationalist in religion, are legitimate deductions from the system of Hegel.

As the sun moves in its orbit, a particular star which had for some time risen after the sun or with him, remaining however invisible, owing to his beams, will at length rise a sufficient length of time before him to be seen. When it does so, this is called its heliacal rising, or it is said to rise heliacally. As in bygone ages the precession of the equinoxes has made various stars in succession rise heliacally, a means, of which Sir Isaac Newton made use, is afforded of computing ancient dates, in cases in which observers have accurately recorded which star in any year rose heliacally.

"The cosmical ascension of a star we term that, when it ariseth together with the sun, or the same degree of the ecliptic wherein the sun abideth; and that the heliacal (ascension), when a star which before for the vicinity of the sun was not visible, being further removed, beginneth to appear."—*Brownie: Vulgar Errors*, bk. iv., ch. xiii.

Photography:

1. A method of printing from a gelatine surface hardened with alum, in the same way as from a lithographic stone. It is based upon the fact that gelatine, impregnated with an alkaline bi-chromate, when exposed to light, loses its power of absorbing water. A warm solution of gelatine containing a sufficiency of bi-chromate of potash, is poured upon a waxed glass-plate, leveled, and allowed to dry. These operations must be performed in a room illuminated by a non-actinic light only. The film is then stripped from the glass, exposed to daylight under a reversed photographic negative, and then fastened to a metal plate. After washing away the superfluous chemicals, it is rolled with ordinary lithographic ink, which adheres to the gelatine more or less, according to the amount of change produced by the light, and the consequent absorption of the water by the film. It is then ready for printing in an ordinary lithographic press. [*LITHOGRAPHY*.]

2. A picture produced by such a process.

hēll, ***helle**, s. [A. S. *hel*, *helle*; cogn. with Dut. *hel*; Icel. *hel*; Dan. *helvede*; Sw. *helvede* (from A. S.

helle-wite=hell torment); Ger. *hölle*; Goth. *halja*; O. H. Ger. *hella*, from the same root as A. S. *helan*; Ger. *hehlen*=to hide.]

I. Ordinary Language:

1. In the same sense as II.

2. Wicked spirits, the infernal powers.

"In despite of the devils and hell, have through the very midst of you!"—*Shakesp. Henry VI., Pt. II., iv. 8.*

3. The place or state of punishment of the wicked after this life.

7. Torment, torture.

He brings, and round about him,"
Milton: P. L., iv. 20.

II. Religions:

1. **Ethnic**: "Hell," as a place of punishment, is found, with more or less distinctness, in nearly all ethnic forms of religions, the precise nature of the punishment varying widely. Three definite stages in the concept of hell may be traced: (1) a vague notion of a future life, to be spent in misery, with little or no idea of moral retribution; (2) it ranks as a place of torment for those who have offended the gods, but is conceived as limited in duration; and (3) it becomes an important factor in the moral government of the universe, a place where evil deeds done in this life are rigorously punished. Tylor says that the idea of a fiery abyss is so seldom recognized among the lower races that the few cases in which it does occur lie open to a suspicion of not being purely native.

¶ For the classic conception of the place of woe, see Tartarus.

2. **Judaism and Christianity**:

(1) In the Old Testament used chiefly for Hades (q. v.), as in Psalm xviii. 5, cxvi. 3, cxxxix. 8, Prov. v. 5, Isa. xiv. 9; Hab. ii. 5. More rarely in the New Testament it is used in the same sense, as in Acts. ii. 31 with reference to Psalm xvi. 10, and apparently in Rev. i. 18, vi. 8, xx. 13, 14, though the language is mostly figurative. In the Apostles' Creed the article "He descended into hell" means into Hades. This sense of the word is now obsolete, except in old formulas or other archaic writings.

(2) The place of woe. This is the common New Testament sense of the word, and is the rendering of Gr. *Geenna* (GEHENNA). Of those cast into it Jesus says, "Where their worm dieth not, and their fire is not quenched" (Mark ix. 44, 46-48), the language being adapted from Isa. lxvi. 24. This fire is said to be everlasting fire, prepared for the devil and his angels (Matt. xxv. 41).

1. *Arm.*: A piece of defensive armor for the head; a defensive covering for the head. It was originally made of leather, and afterward strengthened by the addition of bronze and other metals, until finally it was constructed entirely of metal, lined with felt or wadding.

In the Middle Ages helmets were frequently inlaid with gold, and provided with bars and movable flaps to cover the face in battle, and to be opened at other times. A full-barred helmet covered the whole of the head, face, and neck. It had openings and slits in front to enable the wearer to breathe and see. The open helmet covered only the head, ears, and neck, leaving the face uncovered. The form of the helmet varied from the simple skull-cap to that surmounted with a lofty ridge and crest or plume. The crest was frequently made of horse-hair, and sometimes the helmet had two or even three crests. The Anglo-Saxon helmet was merely a conical cap, with a nasal piece, which afterward became improved into a face-guard, visor, or beaver. The helmet is still worn as a protection to the head among soldiers: the military helmet, as now worn, does not cover or protect the face. In this country helmets are worn by firemen to protect them from falling pieces of burning wood, when extinguishing fires. In tropical countries helmets are made of soft white felt, wrapped round with folds of linen, to protect the head of the wearer from the heat of the sun.

Biol.: The tendency which there is in each animal or plant, in all essential characters, to resemble its parents, so as to be of the same species, and even variety, as they are, though minute differences are certain to arise. In some cases these differences themselves tend to be reproduced in successive generations: thus Mr. E. B. Poulton showed that "the strength of heredity" was such in cats with an abnormal number of toes, that between 1879 and 1883 the peculiarity had been traced through eight successive generations. In other cases the movement is in a contrary direction, producing a reversion to ancestral types. [REVERSION, ATAVISM.]

Heresiologists are usually divided into three classes: (1) Those who had to oppose the originators and supporters of heresies; (2) Those who dealt with the subject as an incident in ecclesiastical history; and (3) Those who undertook the history of any particular sect, or of all which came within their knowledge. (*Blunt*: *Dict. of Sects* (1874), p. 184.)

Sense 1 is from *haireō*=to take, 2 is from *haireōmai*=to take for one's self.]

1. *Script.*: The English word "heresy" does not occur in the Old Testament; in the New it is found four times, and "heretic" once. In none of these has it the classic sense of choice or philosophical tenets or sects. In 1 Cor. xi. 15 it seems to mean parties, without implying that any of these held erroneous theological views. The R. V. places "heresies" in the text and "factions" in the margin. In Gal. v. 20 it appears to have the same meaning, for it is coupled with "hatred, variance, emulations, strife, seditions" (A. V.), "epimities, strife, jealousies, wraths, factions, divisions" (R. V.). The R. V. puts "heresies" in the text and "parties" in the margin. In Acts xxiv. 4 it means difference in methods of worship. In 2 Peter ii. 1 it is unequivocally error in doctrine, and it is on this last passage alone that the modern ecclesiastical use of the word has been founded. In Acts v. 17, xv. 5, xxiv. 5, xxvi. 5, xxviii. 22, *haireisis* is translated "sect."

"There shall be false teachers among you, who privily shall bring in damnable *heresies*, even denying the Lord who bought them, and shall bring upon themselves swift destruction."—2 Peter ii. 1.

2. *Ecclesiol., Ch. & Civil Hist.*: The sense here is religious error, departure from what is held to be true doctrine. Heresy has always existed in the Church. For the efforts to extirpate it, see HERETIC.

3. *Roman Theol.*: A voluntary state of error and obstinate continuance therein on the part of a Christian touching a truth or truths revealed by God, and proposed by the Church to the world. This is formal heresy, and this alone, whether merely mental or manifested exteriorly, incurs a spiritual penalty. The heresy is material when the error is persisted in and defended in good faith and through invincible ignorance (q. v.). Objective heresy is the erroneous opinion itself, whether held in good faith or not.

T.).] [HERESY.]

A. As substantive:

1. Ordinary Language:

1. In the same sense as II.

2. *Fig.*: One who differs from others on a political, a scientific, or any other question. In this sense it is often used by the individual himself humorously.

II. Technically:

1. *Ecclesiol., Ch. & Civil Hist., &c.*: One who adopts, and probably propagates, religious views which the Church to which he belongs, or the Christian Church in general, deems erroneous, and imperiling the eternal salvation of any one holding them. Certain causes have in every age and country produced heresy, and will forever continue to do so. Some minds are compelled by their constitution to think independently on religious and other subjects, and in consequence tend to adopt new views; they receive ill treatment, which confirms them, excites sympathy in others, and in some cases leads the sympathizers to adopt the same tenets. Heresies began in the Apostolic age. There were, for instance, Hymeneus and Philetus, who said that the resurrection was already past (2 Tim. ii. 17), and apparently the Nicolaitans, though they are censured for hateful deeds rather than doctrines (Rev. ii. 6). In Mosheim's *Church History* there is a chapter under each century headed "History of Sects and Heresies," and in no case is the chapter left blank. In treating of opinions held by heretics, it should be remembered that the statements of the accusers are *ex parte*, and that there are not materials for an impartial judgment, unless some book or document penned by the other side is obtainable. The Scripture direction for dealing ecclesiastically with heresies is given in Titus iii. 10: "A man that is an heretic after the first and second admonition reject." When the Church gained an influence over the civil power, it induced the latter to superadd civil to the ecclesiastical penalties for heresy. Those who differed from the opinions of the imperial house received many kinds of ill-usage, but it was not till A. D. 382 that a law of Theodosius I., directed against the Manichæans, authorized capital punishment for heresy. This law led to the execution at Treves, in A. D. 385, of Priscillian, Bishop of Avila; he is believed to have been the first person put to death by a Christian government for heresy. Many disapproved of the cruelty, but ultimately the bad precedent was followed. The oppression of the "heretics" made many of them side with the Mohammedans during the conflict of the latter with the orthodox Christians. [II. 2.]

2. *English Law*: In mediæval times it was supposed that the proper method of dealing with a heretic was to burn him alive, and accordingly there was a writ "De heretico comburendo" (About burning a heretic), regarding which Blackstone says that it "is thought by some to be as ancient as the common law itself." The conviction of heresy by the common law was, however, by the archbishop in a provincial synod, and the delinquent was handed over to the civil power. If the writ "De heretico comburendo" was issued, it was by the special direction of the king in council, with whom also the power rested of refusing to put the writ in force. During that part of the Reformation struggle in England in which the government was Roman Catholic, a heretic specially meant a Protestant; but by 25 Henry VIII. c. 14 departure from the tenets of the Church of Rome was declared not to be heresy; 1 Eliz. c. 1 in name swept away the penal statutes against heretics, leaving them to be dealt with by ecclesiastical courts; but it was not till 1676 that 29 Chas. II., c. 9, § 1, actually removed the writ from the statute-book.

B. As *adj.*: Heretical.

"Eachewe thou a man *eretike* aftir oon and the secounde correccioun."—Wycliffe: *Titus* iv.

¶ The heretic is considered as such with regard to the Catholic Church or the whole body of Christians, holding the same fundamental principles; but the *schismatic* and *sectarian* are considered as such with regard to particular established bodies of Christians. *Dissenters* are not necessarily either *schismatics* or *sectarians*, for British Roman Catholics and the Presbyterians of Scotland are all *dissenters*. It is equally clear that all *schismatics* and *sectarians* are not *dissenters*, because every established community of Christians, all over the world, have had individuals or smaller bodies of individuals setting themselves up against them: the term *nonconformist* is a more special term, including only such as do not conform to some established or national religion. Occasionally human beings are born combining some characteristics of the two sexes, but every one of these is essentially male or female. Some of the inferior animals, though fewer than was once supposed, really combine the characters of the two opposite sexes, to such an extent as to be able to propagate their own kind. But as Sprengel, Knight, and Kolreuter suspected, and Darwin proved, in the case of all hermaphrodites, two individuals either occasionally or habitually concur in the reproduction of their kind.

1. *Myth.*: The name given by the Greeks to the god known by the Romans as Mercury (q. v.).

2. *Gr. Antiq. (pl.)*: Statues of Hermes, or Mercury, which were set up by the inhabitants of Athens at the doors of their houses, and sometimes also in the peristyle. They consisted of a bust, affixed to a quadrangular stone pillar, diminishing toward the base. They were also set up to mark the boundaries of lands, at the junctions of roads, at the corners of streets, and in other prominent places, and even as posts for ornamental railing to a garden. The hermes was the result of the first attempt at the artistic development of the blocks of stone and wood, by which, in the earliest period of idol-worship, all the divinities were represented, simply by adding to them a head, in the features of which the characteristics of the god were supposed to be expressed. Sometimes the head was double, triple, or even fourfold.

hěr-měg'-lč-an-ǝm, s. [For. etym. see def.]

Ch. Hist.: The method of religious inquiry taught by George Hermes, born near Münster April 22, 1775; in 1819 he became professor of theology at Rome, where he died May 26, 1831. Hermes combined with the Roman Catholicism, to which he was sincerely attached, a strong tendency toward philosophy. He was of opinion that reason must first be exercised in establishing a Divine revelation and the claims of the Church of Rome infallibly to interpret its teaching. Reason then itself required an implicit acceptance of all the doctrines of the Church. These views he published, in 1819, in an *Introduction to Christian-Catholic Theology*. His old students and other admirers, who were numerous, adopted his method, with the result that they tended to move, not toward, but away from the Church, in consequence of which the Pope, on September 26, 1835, issued a brief against Hermes' work, which was held to be of infidel tendency. A vehement controversy on the subject sprung up in Germany, the Prussian Government, offended by the way the brief was carried out, coming into collision with the Court of Rome.

2. *Pl.* (*Hieroglyphs, hieroglyphics*): Representations of animals, plants, and other more or less material bodies, sculptured on Egyptian temples, obelisks, sarcophagi, &c., and designed for ideographic or other writings. All attempts to read hieroglyphics had for centuries been given up, when, in August, 1799, the French found among the ruins of Fort St. Julien, near the Rosetta branch of the Nile, a stone, which has since been called the Rosetta Stone. It was afterward taken from a French vessel by William R. Hamilton, and is now in the British Museum.

It contains an inscription regarding the coronation of Ptolemy V. (Epiphanes), and is believed to have been sculptured about 195 B. C. The inscription is first in hieroglyphics, next in the hieratic character of Egypt, and in Greek, which afforded a key to the hieroglyphics, but one very difficult to apply. Silvestre de Sacy in 1801, Akerblad in 1802, the younger Champollion in 1814, 1821, 1836, 1841, with Dr. T. Young, most successful of any, in 1819, and Rossellini in 1825, 1826, &c., all made advances toward solving the enigma, so that Dr. Birch, of the Biblical Archaeological Society, and other Egyptologists are now continually translating hieroglyphics from the

Egyptian Hieroglyphics.

monuments. Hieroglyphics are of two kinds: some are ideographs (q. v.), others stand for syllables or for letters. They are not confined to Egypt; they exist in the adjacent lands, and in Mexico. Professor Sayce shows that there were some hieroglyphics in the Hamathite inscriptions which were probably of Hittite origin (*Trans. Bib. Arch. Soc.*, v., 26, 27). The Mexican hieroglyphics emanated from the ancient Aztecs. Hieroglyphs are a shorter kind of picture writing, which it is thought was the earliest form of all. Hieroglyphics were ultimately modified into alphabetic writing. Thus the Rev. W. Houghton believed in the hieroglyphic or picture origin of the Assyrian Syllabary (*Ibid.*, vi. (1878), p. 452-483, 602), and Endlicher has shown that the "ancient pictures" of the Chinese gave rise to the cursive forms now in use. (*Tylor: Anthropology*, ch. vii.)

1. **Ord. Lang.**: The River horse, *Hippopotamus amphibius* [11.]. It inhabits the great rivers and lakes of Africa. Anciently it was found in the lower part of the Nile: now it does not occur there. Then followed the *Tetraprotodon* (q. v.), to which the living and various fossil forms belong. *Hippopotamus major* is enumerated by Prof. Boyd Dawkins among the Upper Pliocene mammalia of Italy and the Mid Pleistocene mammalia of Britain. It is called by him a survival from the early Pleistocene. The hippopotamus is now found only where the water never freezes, but is of nearly uniform temperature throughout the year. Prof. Boyd Dawkins states that *H. amphibius* was widely diffused in Upper Pliocene times through the forests of France and Italy, and it is found as a survival from the Pliocene in the Early Pleistocene of Britain. The remains of this animal occur here also in the Late Pleistocene, both in river strata and ossiferous caverns.

hippuric-acid, *s.*

Chem.: $C_9H_9NO_3$, or $CH_2 \cdot NH \cdot CO \cdot C_6H_5$.

Benza-
mido-acetic acid. Hippuric acid occurs in the

urine of horses and other graminivora; the quantity depends upon the food—animals fed with oat straw give off the most. When benzoic acid is eaten, it appears in the urine in the form of hippuric acid. The acid can be obtained by evaporating the fresh urine to a thick syrup, and extracting with alcohol, filtering, and then distilling off the alcohol; the residue, when cold, is treated with hydrochloric acid; the color can be removed by dissolving the acid in dilute soda and adding to the boiling liquid a small quantity of permanganate of potassium, filtering off the oxide, and then precipitating the acid by HCl. The pure acid crystallizes in prisms easily soluble in boiling water and in

alcohol; less soluble in ether. It melts over 130°, turning brown. By the action of K_2MnO_4 and caustic soda solution it is decomposed, giving off its nitrogen as ammonia. An aqueous solution of hippuric acid, boiled with PbO_2 , yields benzamide $C_6H_5CO-NH_2$ and CO_2 . Hippuric acid can be prepared synthetically by heating benzoyl chloride C_6H_5CO-Cl with glyccol CH_2NH_2COOH to 120°, zinc oxide being added to neutralize the HCl given out; also by heating to 150° equivalents of benzamide and monochloroacetic acid.

1. The record of the most important bygone events in human history chronologically arranged, with an inquiry into their causes, and the lessons which they afford with regard to human conduct; "philosophy teaching by example." This field of investigation is more limited than that of the Greek *historia*, which was used for research on any subject [Etym.], and somewhat more extensive than the Roman *historia*, which would now be called annals. Accounts of the same event are distorted according to the prejudices or interest of the person by whom they are related. Historians in such cases attempt with cold impartiality to ascertain and record the actual truth. Every nation has great gaps in its early history, which verbal tradition and written poetry have had no scruple in filling up with almost purely mythic narratives; the historian must attempt to discriminate truth from fable. The "eyes of history" are geography and chronology. The locality of an event should be recorded, and the date at which it occurred. If a wrong date be introduced the chain of causation in historic events is destroyed at that point; for every event is in that respect the consequent of those which preceded it, and the antecedent of those which followed. History is often divided into sacred and profane. The former is that obtained from the Bible; the lesson which it was designed to teach is what has been called "God in History." Profane, by which is meant not unholy, but secular, history, specially records the rise and growth of the several Gentile nations. A history may be of an institution, an invention or art gradually perfected, as, the History of Shipbuilding, the History of Painting; or of thought, as, the History of Philosophy. Branches of history now named separately are Archaeology and Biography.

2. A narrative; a verbal relation of important occurrences.

were studying Latin under a private tutor in that town, and, with boylike propensity for adapting all sorts of peculiar sounds to their own use, began hailing each other with "Hello, bobisbit!" Finding this form of salutation rather cumbersome to handle in a hurry, they speedily shortened it to "hobo." This is the history of the word's birth. It was catchy and others fell to using it, but in a different way. Its popularity increased and one can hear the modification at almost any place in the United States. A crowd of tramps is to-day an army of hobos; a flat fed hat is a hobo skypiece; a wandering compositor is a hobo printer; a tough street is a hobo neighborhood, and so on *ad infinitum*.

When wild it is of a dark brindled hue, with soft short hairs beneath its bristles. In domestication the ears become long, sharp-pointed, and pendent. The hog when wild feeds on beech-mast, chestnuts, acorns, crabs, haws, sloes, hips, grass, roots, &c. When he can obtain

miry ground to wallow in, he regales himself with frogs, ferns, the roots of rushes, &c. In domestication he will eat almost anything in the least digestible—an uncleanly but valuable scavenger. The flesh of the hog when fresh is called pork, when cured, ham or bacon. The ordinary lard is used for culinary purposes, the fat of the bowels for greasing axes. The bristles are made into brushes, pencils, &c.; the skin into leather. The dung is only less valuable as manure than that of the sheep. There are many breeds of hogs, as the Chinese, the Suffolk, the Berkshire, the Shropshire, the Northampton, the Neapolitan, &c. The point aimed at, is to make the animal quickly increase in flesh without increasing in bone. Clover, potatoes, turnips, cabbages, carrots, parsnips, lettuces, pea-meal, barley-meal, bran, &c., are useful for fattening hogs. [*SYBOTISM.*] Their period of gestation is about four months; they begin to breed at the age of eighteen months to two years, do so twice in a year, and bring forth from five to ten, or more, at a time. 3. Consecrated or set apart for some sacred use or service; sacred, hallowed, reverend.

† *Holy* conveys the most comprehensive idea; *pious* and *devout* designate most fervour of mind. *Piety* lies in the heart, and may appear externally; but *devotion* does not properly exist except in an external observance: a man *piously* resigns himself to the will of God in the midst of his afflictions; he prays *devoutly* in the bosom of his family. *Divine* signifies either belonging to the Deity or being like the Deity; but from the looseness of its application it has lost in some respects the dignity of its meaning. What is *holy* and *sacred* is in its very nature *divine*; but the *divine* is not always either *holy* or *sacred*. (Crabb: *Eng. Synon.*)

***holy-ale**, *s.* A rural festival; a holiday. [ALE.]

Holy-alliance, *s.*

Hist.: An alliance formed at Paris on Sept. 26, 1815, between the Emperors of Russia and Austria and the King of Prussia. On Dec. 25, 1816, the Emperor of Russia, who was believed to be the real author of the alliance, publicly made known its character. These sovereigns undertook in future to act on the principles of the Gospel, and to support each other's authority. Other sovereigns were invited to join the alliance. The King of England declined the invitation, for this, among other reasons, that the constitution of his country did not permit him personally to sign such a document. Ultimately it became apparent that the object of the alliance was to support absolutism against popular aspirations for constitutional government, and when in 1821 the allied sovereigns invited the cooperation of other countries in putting down revolution at Naples, Lord Castlereagh sent an unfavorable reply. Byron (*Don Juan*, xiv. 83) sneers at the "Holy Three," and to Moore's *Fables for the Holy Alliance* were prefixed Dryden's lines (*Virgil*: *Georg.* iv. 162, 163)—

"Clip the wings
Of these high-flying arbitrary kings."

The Holy Alliance subsequently interfered in the Spanish Revolution, and then disappeared from history.

"Apprehensions at all resembling those which, in our age, induced the Holy Alliance to interfere in the internal troubles of Naples and Spain."—Macaulay: *Hist. Eng.*, ch. ii.

holy-coat, *s.*

Ch. Hist., Relics, &c.: A coat, alleged to be the seamless vestment worn by Jesus at His trial, and for which, after His crucifixion, the soldiers cast lots (John xix. 23, 24). Several exist, the custodians of each claiming that it is the genuine one. The exhibition of one of them at Treves, in 1844, and the actual worship of the coat by some of the pilgrims who resorted thither in multitudes, led to a small secession from the Roman Church, headed by two priests, Ronge and Czerski. The tendencies of Ronge were toward rationalism, those of Czerski toward evangelical Protestantism. Neither rose to much power.

holy-cross, *s.*

1. Ch. Hist., Relics, &c.: What is alleged to be the actual cross on which Christ suffered. Rufinus, Socrates, Sozomen, Theodoretus, &c., relate the discovery (about A. D. 326) by Helena, mother of Constantine, of three crosses, with the inscription in Greek, Hebrew, and Latin. The question which of the three was the cross of Jesus was satisfactorily settled when, on the suggestion of Macarius, bishop of Jerusalem, trial was made which could work miracles, and it was found that only one had this power. Eusebius, who was well acquainted with the parties concerned, seems never to have heard of these alleged discoveries.

He is identical with the Comforter (q. v.) or Paraclete (q. v.) (John xiv. 26). Whether he "proceeds" from the Father alone, or from the Father and Son, is a question which has divided the Eastern and Western Churches. holy-water, *s.*

Ch. Hist., Ritual, &c.: In Numbers (viii, 7) we read of the preparation of a "water of purifying," and (xix, 9) of a "water of separation," which is "a purification for sin." The custom passed with appropriate ceremonies into the early Christian Church. Water is blessed, or made "holy-water," by any cleric in priest's orders. The service may be consulted in the *Rituale Romanum*, or in English in Rock's *Hierurgia* (ch. xiii.). In the Roman Church it is usual to sprinkle the altar and the people with holy-water immediately before the high-mass on Sundays, "to remind them that they ought to appear before God with a pure heart, to awaken penitential feelings, and to wash them from venial sins." (*Goschler*.) In the Greek Church this observance is confined to the first Sunday of the month.

Holy-water is also employed whenever anything is solemnly blessed. Stoups of it are placed at the entrance of all churches; into them the people dip their fingers, signing themselves with the cross with the right hand, touching first the forehead, then the center of the breast, then the left and right shoulders, saying, "In the name of the Father, and of the Son, and of the Holy Ghost." Catholics keep

it in their houses, and use it on retiring to rest, on getting up, before undertaking a journey, or in time of temptation. [ILLUSTRATION.]

holy-week, *s.*

Ch. Hist., Ritual, &c.: The week from Palm Sunday to Holy Saturday, or Easter-even, inclusive. In the English Episcopal Church, each day has a proper epistle and gospel, and the psalms on Good Friday are also proper. Of late the observance of holy-week has become general; in many churches passion-music (q. v.) is chanted and, especially among the Ritualists, the services on Good Friday have direct reference to the solemn events which that day commemorates. In the Roman Church the whole of the functions are peculiarly solemn and impressive; those of Holy Thursday are marked by pomp and splendor. On Palm Sunday the Passion according to St. Matthew is chanted, and palm-branches (or sprigs of willow in their stead) are blessed and distributed to the people (John xii. 12-15). Tenebræ are chanted on Wednesday, Holy Thursday, and Good Friday; on Holy Thursday at high-mass two Hosts are consecrated, the oils and chrisms are blessed, the Host for Friday's mass is carried processionally to the reposoir, while the "Pange Lingua" is sung, and, in cathedral churches and religious houses, the Washing of the Feet (John xiii. 4-7) follows. On Good Friday the altar and sanctuary are stripped of their ornaments, the Passion according to St. John is chanted, the crucifix is unveiled and kissed by the clergy, kneeling, while the Improperia or Reproaches are sung, the consecrated species is brought from the reposoir, and the celebrant says the Mass of the Presanctified (q. v.); on Holy Saturday there is the blessing of the fire, the paschal candle, and the baptismal font.

holy-wells, *s. pl.*

Compar. Relig.: In very many forms of faith water plays an important part, and is invested with miraculous powers. In the Old Testament we have the cleansing of Naaman in the Jordan (2 Kings v.); in the New, the man "blind from his birth," who "washed and came seeing" (John ix.), and the "troubing of the water" (John v.). Horace (*Od.*, iii. 13) and Ovid (*Fast.*, v. 300) speak of sacrifices to holy-wells, and Juvenal (vi. 533) mentions the oracular fountain of Jupiter Ammon. When Paganism was yielding to a purer faith, laws were passed forbidding the old adoration at fountains, but Tylor says (*Prim. Cult.*, ii. 105), "with a varnish of Christianity, and sometimes the substitution of a saint's name, water worship has held its own to our day." St. Winifred's Well, at Holywell, Flintshire, has still many votaries; Ireland and Scotland can show their holy-wells in scores of parishes, and in the latter country some bush adjacent, bedecked with rags testifies to the survival, in a mutilated form, of the rite of sacrifice. Bishop Hall (*Invisible World*, bk. ii, § 8), bears witness to a cure wrought upon a cripple by the waters of St. Madern's Well, and the virtues of the "water which sprang forth under the hands of Bernadette at the command of the Virgin Mary" (*Lasserre: Notre Dame de Lourdes*, liv. iii., § vii.) are boldly asserted by that Parisian journalist, who claims to be one subject among many of its miraculous efficacy.

"Cornish-folk still drop into the old holy-wells offerings of pins, nails, and rags, expecting from their waters cure for diseases, and omens from their bubbles."—*Tylor: Primitive Culture*, ii. 195.

professing, that 'he did become his man, from that day forth, of life and limb and earthly honor;' and then he received a kiss from his lord. Home Rule, s.

Eng. Hist. & Polit.: The government of a country by means of an authority which has its seat within the country itself, the members of the government being elected by and from its inhabitants. As generally used, the expression indicates local self-government, as distinguished from national independence; a country being said to be in the enjoyment of Home Rule when it manages for itself concerns which are peculiarly its own, while being still subject to the jurisdiction of an Imperial Government. The term is used specifically in connection with Irish politics. For some years previously to 1885 a Home Rule party, composed of a section of the Irish representatives, had existed in the House of Commons, and at the General Election in that year fought under the new Reform Acts, it was largely reinforced, it now being about five-sixths of the Irish representation. In deference to this expression of Irish feeling, Mr. Gladstone, as the head of an Administration which had been formed with special view to this question, brought forward a Bill for establishing in Dublin a Parliament, with an Executive Government, for dealing with all affairs specially Irish. The measure was accepted by Mr. Parnell on behalf of the Home Rulers as a reasonable fulfillment of Irish demands, but it excited a great deal of opposition, not only from the Conservatives, but also from an important section of the Liberal party, and was defeated by a large majority, together with a Bill for buying out the Irish landlords. Mr. Gladstone then (1886) appealed to the country, and the result being unfavorable, resigned, and was succeeded by the Marquis of Salisbury. Mr. Gladstone on again becoming the head of the Administration brought forward another Irish Home Rule Bill, which was likewise defeated. Mr. Gladstone again resigned (March, 1894), and was succeeded by the Earl of Rosebery.

"Mr. Gladstone was anxious to link his name with home rule for Ireland, and should his immediate successor succeed in carrying out that idea the credit of it would be given to the venerable statesman who gave to it the marvelous energies of his old age." Chicago *Inter Ocean*, March 31, 1894.

¶ Homicide is said to have been tried at Athens by the Aroepagites. Among the Jews, wilful murder was capital; but for accidental murder the offender was to flee to one of the cities of refuge, and to continue there till the death of the high-priest (see Numbers xxxv). This was 1451 B. C.

In 1828, an act was passed in England distinguishing between justifiable homicide and homicide in its various degrees of guilt and circumstances of provocation and willfulness.

Animals have been tried and punished for killing human beings. A bull was hanged for homicide near the abbey of Beaurps in May, 1489.

II. Law: (See extract)

"Homicide is of three kinds: justifiable, excusable, and felonious. . . . 1. Justifiable homicide is of divers kinds: (1) Such as is owing to some unavoidable necessity, without any will, intention, or desire, and without any inadvertence or negligence in the party killing, and therefore without any shadow of blame. (2) Homicides committed for the advancement of public justice are: (c) Where an officer, in the execution of his office, kills a person that assaults and resists him. (b) If an officer, or any private person, attempts to take a man charged with felony, and is resisted, and, in the endeavor to take him, kills him. (d) In case of a riot or rebellious assembly, as has already been explained. (e) Where the prisoners in a jail, or going to a jail, assault the jailer or officer, and he in his defense kills any of them, it is justifiable for the sake of preventing an escape. . . . (3) Such homicide as is committed for the prevention of any forcible and atrocious crime is justifiable by the law of nature. . . . 2. Excusable homicide is of two sorts: either *per infortunium*, or *per misadventure*. Homicide *per infortunium*, or misadventure, is where a man doing a lawful act, without any intention of hurt, unfortunately kills another. . . . 3. Felonious homicide is an act of a very different nature from the former, being the killing of a human creature, of any age or sex, without justification or excuse. This may be done either by killing one's self or another man."—*Blackstone: Comment.*, bk. iv., ch. 14.

Med.: The system of medicine which aims at curing diseases by administering medicines which produce symptoms similar to those which they are designed to remove. The Latin dictum on the subject is "Similia similibus curantur." Its founder was Samuel Hahnemann (1755-1843), born at Meissen in Upper Saxony. In 1790, while investigating the operation of Peruvian bark in intermittent fevers, he found that a dose of the bark which he took produced in himself phenomena like those of the fever it was designed to combat. Pursuing his experiments, he believed he had discovered a general law that like was cured by like, and in 1810 published his *Organon of the Healing Art*, in which he explained his system, calling it for the first time homœopathy. Thus to rub the affected part with snow is beneficial in frostbite, so are heated spirits of wine or oil of turpentine in burns. He appealed also to the effects of vaccination in preventing or mitigating small-pox. This, however, is not curing like by like, though there is a certain analogy between the two cases. Hahnemann and his followers have attempted experimentally to ascertain what therapeutic agent to prescribe in each case. Experience has shown them that the doses should be exceedingly minute. The great majority of medical men reject the system, though it has many advocates here and abroad. Homœopathy is opposed to Heteropathy or Allopathy (q. v.).

hō-m-ō-tāx-ig, s. [Pref. *homo-*, and Gr. *taxis*=arranging.]

Geology:

1. *Gen.*: The arrangement of strata in different localities, apparently in the same relative position in the geological series, without its being known whether or not they are contemporaneous.

2. *Spec.*: The existence of the same fossils, or many of them, in strata widely separated in geographical position, or at least not occurring together, so as to have their relative age tested by proved continuity, or by visible superposition. Formerly the occurrence of such beds, even in remotely separated regions, say Britain and India, was held to prove the absolute contemporaneity of the periods at which the respective strata were deposited; now it is held that the presumption is against their being quite contemporaneous; for if the organisms came into being in one of the two regions, they would naturally take some time to spread to the other. Professor Huxley, objecting to the use of the word "contemporaneity" in such cases, proposed to substitute for it "homotaxis."

"The use of the word *homotaxis*, instead of 'synchronism,' has not, so far as I know, found much favor in the eyes of geologists. I hope, therefore, that it is a love for scientific caution, and not mere personal affection for a bantling of my own, that leads me to think that the change of phrase is of importance."—*Prof. Huxley: Presid. 1. Bot. & Zool.: A product primarily of a vegetable character, in many plants existing at the base of the corolla, sometimes in a more or less elongated tube, closed at the lower end, called by Linnaeus, on account of its contents, a nectary. Nectar bees collect it to store against winter, and swallowing, it by means of their proboscis, transfer it to a distended portion of the oesophagus, called the honey-bag. There certain chemical changes take place upon it, so that when placed, as it ultimately is, in the honeycomb, it is not, as at first, exclusively a vegetable product. When elaborated by young bees it is whiter than in other cases, and is called virgin honey. When obtained by the bees from some plants, it is poisonous. I. Ordinary Language:

2. **Fig.:** Anything bounding one's mental vision.

"While the authors of all these evils were idly and stupidly gazing on this menacing meteor, which blackened all their horizon."—Burke: *On the Nabob of Arcot's Debts*.

II. Technically:

1. **Astron.:** The horizon, in the sense I. 1, is called by astronomers the sensible, visible, or physical horizon. It is not at right angles to a vertical line at the place, for if vision be unimpeded, say when one looks from a vessel's deck on a clear day, the rotundity of the earth allows him to see a little more of the sky than if his eye were at the surface of the sphere. If he looks from a mountain top the error becomes of consequence. The term "sensible," "visible," or "physical" horizon is therefore often used, though not quite accurately, for a plane supposed to be extended from the observer's eye at right angles to a vertical line at the place and extending to the celestial vault. The horizon convenient for astronomical purposes, and called the astronomical or rational horizon, is different from this. The spectator's eye is supposed to be, not at the surface, but at the center of the earth, with the planet transparent enough not to impede vision. The astronomical horizon of the Lick observatory would be obtained by supposing a line drawn downward from that spot to the earth's center, and a plane everywhere at right angles to that line, to extend from the latter spot to the celestial vault. It would form a great circle, both of the earth and of the heavens. Sometimes what is called an "artificial horizon" is needed, and is formed by the reflecting surface of a fluid.

2. **Geol.:** A term used with regard to the apparent age of strata. Strata which appear, broadly speaking, contemporaneous or homotaxial are said to be on the same horizon.

7. *Print*: A slanting-board at the end of the bank or table to hold a supply of paper for a press.

8. *Zoöl., etc.*: *Equus caballus*. The native country of the horse seems to have been Central Asia. It became early domesticated in Egypt. In the sculptured battle scenes representing the conquests of Thothmes II. and III. over Asiatic foes, horses, some ridden by men, others drawing chariots, figure both in the Egyptian and the hostile army. It is mentioned throughout the Bible. The people of Thessaly were excellent equestrians, and probably first among the Greeks who broke them in for service in war; whence probably arose the fable that Thessaly was originally inhabited by centaurs. "Solomon had 40,000 stalls of horses for his chariots, and 12,000 horsemen," 1014 B. C. (1 Kings iv. 26.) The Greeks and Romans had some covering to secure their horses' hoofs from injury. In the ninth century horses were only shod in time of frost. Shoeing was introduced into England by William I., 1066. It is believed that the original breed of horses is extinct, and that the half-wild herds existing in many places have descended from animals once in captivity. Thus when the horse was first introduced by the Spaniards in A. D. 1537 at Buenos Ayres, it is believed that there were no wild horses in America. But individuals escaping ran wild, and by 1580 their descendants had spread over the continent as far as the Straits of Magellan. Their favorite abode is on the Pampas, where they now exist in untold numbers. In Paraguay the larva of a fly kills them. In 1764 they were introduced into the Falkland Islands by the French with a similar result. But there was found in La Plata a now extinct species of horse [EQUIDE], and more EQUIDE have been found in the New than in the Old World. The horse may have descended from a striped ancestor, stripes still sometimes remaining, especially in duns and mouse-duns. His present colors are brown, gray, or black, sometimes with roundish pale spots. His age is ascertained by examining first which teeth are developed, and then to what extent they have been worn away by use. They are best tamed by kindness. Like other domestic animals the horse has run into various breeds. The most celebrated is the Arab horse. The racehorse, the hunter, the carriage horse, &c., all vary considerably in character.

*9. *Astron.*: A constellation.

† Properly it is a little horse. [EQUULEUS.]

10. *Scrit.*: The rendering "horse" is accurate. It stands for three Hebrew words, *sûs*=a horse in general, *parash*=a riding horse, a horseman, and *rekes*

=the dromedary of the A. V., but believed by Genesis and others to be a swift horse. There is also once *rammak*=a mare (Esther viii. 10). A magnificent poetic description of the horse as trained for war is given in Job xxxix. 19-25. Doubtless deviations had already arisen from the primeval type.

Called a noun, it is really the infin. absolute of Heb. *yasha*=to set free, to save, to assist [JESUS, JOSHUA]; Sept. Heb. *Osée*, N. T. *Hōsée*.]

Scrip. Hist.: Hosea, called in the New Testament (A. V.) Osee (Rom. ix. 25), the writer of the prophecies bearing his name, was the son of Beeri. Of his history nothing authentic is known, except what can be gleaned from his writings.

† *The Prophecies of Hosea*:

Scrip. Canon: The first of the twelve minor prophets, according to the arrangement in the Hebrew Bible, but not in point of time, for Jonah, Amos, and perhaps Joel, were earlier in date. When Hosea began to prophesy, Uzziah was King of Judah and Jeroboam II. King of Israel; when he died Hezekiah was reigning in Judah (Hosea i. 1). Jeroboam II. reigned forty years, from B. C. 823 to B. C. 783; Uzziah, called also Azariah, began to reign B. C. 809. Hosea's prophecies, therefore, cannot have begun earlier than this latter date. Hezekiah came to the throne B. C. 726. The minimum span of Hosea's prophetic life would therefore be from B. C. 783 to B. C. 726—i. e., fifty-seven years. During some period of his career he was contemporary with Isaiah and Amos. The denunciations of the prophet were directed mainly against the kingdom of Israel, that of the ten tribes, which, after the death of Jeroboam, sank into a low state religiously, morally, and politically. Hosea is quoted or referred to in the following New Testament passages: Hosea i. 10, ii. 23 in Rom. ix. 25, 26; vi. 2 in 1 Cor. xv. 4; vi. 6 in Matt. ix. 13, xii. 7; x. 8 in Luke xxiii. 30, Rev. vi. 16; xi. 1 in Matt. ii. 15; and xiv. 2 in Heb. xiii. 15.

Hū-guē-nōt, s. & a. [Many etymologies have been given, all on the supposition that the word did not arise before the Reformation. But mention is made under date Oct. 7, 1387, of a Pascal Huguenot, from St. Julien, in Limousin. It was, therefore, derived from some individual. The word *Huguenot* is believed by Mahn and Littré to be the diminutive of *Hugues*. The first known use of the word in the now established sense was in a letter from the Count de Villars, lieutenant-general in Languedoc, dated Nov. 11, 1560. (Littré.)

A. As substantive:

Hist.: A nickname formerly applied by the Roman Catholics to the Protestants of France, who were nearly all Calvinists, and who converted the appellation into one of honor instead of reproach. D'Aubigné believed that the Reformation began in France in A. D. 1512, while that of Switzerland commenced in 1516, and that of Germany in 1517. For a time France seemed as likely as the other two countries to adopt Protestantism. Though Margaret, the sister of Francis I., had favored it, yet that king had been strongly against it, at least during the latter part of his reign, as were Francis II. and Henry II. It arose among the people, and through their sympathy became so formidable, that when, in 1561, a year after the accession of Charles IX., the Huguenots were prohibited from preaching, they took up arms to achieve religious liberty. The chief seat of their power was in the south and west of France, that of the Catholics in the north and east. With an occasional hollow truce, or an interval of peace as hollow, the struggle went on for the next century and a quarter. Its two most notable incidents were the Massacre of St. Bartholomew, August 24, 1572 (BARTHOLOMEW), and the Revocation of the Edict of Nantes, Oct. 22, 1685 (REVOCATION). The name Huguenot has not been permanent. Those so called were afterward denominated Reformed or simply Protestant.

II. Technically:

1. *Anat., &c.*: A liquid, a fluid. [¶ 1.]
 2. *Phys.*: According to Galen, &c., there are four humors, blood, choler, phlegm, and melancholy, lying at the bases respectively of the sanguineous, the bilious, the phlegmatic, and the melancholic temperaments. He believed that if all these humors were mixed in equal proportions, the temperament was a perfect one, but if, as was almost always the case, some one markedly predominated, then a person would show certain mental peculiarities produced by, or at least in harmony with the particular humor which preponderated in his physical temperament.

3. *Mental Phil.*: A mental faculty which tends to discover incongruous resemblances between things

which essentially differ, or essential differences between things put forth as the same; the result being internal mirth or an outburst of laughter. Wit does so likewise, but the two are different. Humor has deep human sympathy, and loves men while raising a laugh against their weaknesses. Wit is deficient in sympathy, and there is often a sting in its ridicule. Somewhat contemptuous of mankind, it has not the patience to study them thoroughly, but must content itself with noting superficial resemblances or differences. Humor is patient and keenly observant, and penetrates beneath the surface; while, therefore, the sallies of wit are often one-sided and unfair, those of humor are, as a rule, just and wise.

¶ 1. *Aqueous humor*: [AQUEOUS EYE.]

¶ 2. *Bad humor*:

(2) [GOOD-HUMOR.]

4. *Vitreous humor*: [EYE, VITREOUS.]

¶ Humor is general; caprice is particular; humor may be good or bad; caprice is always taken in a bad sense. Humor is always independent of fixed principle; it is the feeling or impulse of the moment; caprice is always opposed to fixed principle, or rational motives of acting; it is the feeling of the individual setting at naught all rule, and defying all reason. (Crabb: *Eng. Synon.*)

Under the influence of Professor Cullen (1712-1790) and others, the humoral pathology was largely ignored, though in certain respects it still holds its ground. B. As subst. (pl.): The followers of John Huss, who was born of humble parents, at Hussinatz in Bohemia, about A. D. 1370, and became priest in 1400. Huss was a realist in philosophy, and adopted the views of Wycliffe, whose works he translated, giving great offence to the Archbishop of Prague. Huss appeared by citation before the Council of Constance, and, though provided with a safe-conduct from the Emperor Sigismund, or Sigismund, he was adjudged a heretic, and burned alive July 6, 1415, as was his disciple Jerome of Prague, on May 30, 1416. By the decision of this Council, the request of the Bohemian laity to communicate under two kinds was refused. The treatment of Huss exasperated his followers, and led to a religious war in which great ferocity and cruelty were manifested on both sides. The Hussite leaders were John Ziska, or Zizka, and after his death Procopius. Sigismund commanded the imperial forces. The Hussites fortified a mountain near Prague which they called Mount Tabor. [*TABORITES*.] Ziska was victorious in thirteen pitched battles and a hundred engagements and sieges, though, losing his second eye by an arrow, the first having been destroyed in his youth, he had to lead without the gift of sight. He died Oct. 12, 1424, soon after he had obtained

religious liberty for Bohemia. Before this the Hussites had begun to split into minor sects, as the Orebites, or Horebites, the Orphanites, and the Calixtines (*q. v.*). In 1433, the Calixtines were conciliated by the concession of the cup to the laity. [*UTRAQUISTS*.] By the treaty of 1435, Sigismund was acknowledged king of Bohemia, which, however, remained in an uneasy state. The Hussite troubles prepared the way for the Lutheran Reformation.

Huttonian-theory, *s.*

Geol.: The theory first published by Dr. Hutton, in 1785, in his *Theory of the Earth*, and developed in 1795. He was the first to distinguish between cosmogony and geology, believing the latter to be in no way concerned with "questions as to the origin of things." He says that—

"The ruins of an older world are visible in the present structure of our planet, and the strata which now compose our continents have been once beneath the sea, and were formed out of the waste of preëxisting continents. The same forces are still destroying, by chemical decomposition or mechanical violence, even the hardest rocks and transporting the materials to the sea, where they are spread out and form strata analogous to those of more ancient date. Although loosely deposited along the bottom of the ocean, they become afterward altered and consolidated by volcanic heat, and then heaved up fractured and contorted."

Hutton was the precursor of Sir Charles Lyell, whose views were essentially the same, and who procured for them large acceptance among geologists. Professor Huxley called the Huttonian theory Uniformitarianism (q. v.). (GEOLOGY, PLUTONISTS, VULCANISTS.)

hy-brīd-īg-ēr, s. [HYBRIDIZER.]

hy-brīd-īgm, s. [Eng. *hybrid*; *-ism*.]

Biol.: The state or quality of being hybrid; hybridity.

It was long believed that hybrids were uniformly sterile, and had been made so to prevent the confusion of species. Darwin (*Origin of Species*, ch. ix.) combats this view, pointing out that two classes of facts, to a great extent fundamentally different, have generally been confounded—viz., the sterility of species when first crossed, and the sterility of the hybrids produced from them.

"First crosses between forms sufficiently distinct to be ranked as species and their hybrids are very generally, but not universally, sterile. The sterility is of all degrees, and is often so slight that the most careful experimentalists have arrived at diametrically opposite conclusions in ranking forms by this test. The sterility is innately variable in individuals of the same species, and is eminently susceptible to the action of favorable and unfavorable conditions. The degree of sterility does not strictly follow systematic affinity, but is governed by several curious and complex laws. It is generally different, and sometimes widely different, on reciprocal crosses between the same two species. It is not always equal in degree in a first cross, and in the hybrids produced from this cross."—Darwin: *Origin of Species* (6th ed.), 262.

Mr. Darwin believed that the sterility of first crosses and that of their hybrid progeny had not been effected by natural selection; it had arisen from various causes. Nor, he thought, are mongrels—i. e., crosses between varieties, uniformly fertile; he considered, therefore, that there was nothing in the phenomena of hybridization to negative the view that species had first existed as varieties.

1. Lit. & Gr. Myth.: A celebrated monster which infested the Lake Lerna in Peloponnesus. It was the offspring of Ichidna's union with Typhon. It had one hundred heads, and as soon as one was cut off, two grew up if the wound was not stopped by fire. It was one of the labors of Hercules to destroy this monster; this he effected with the assistance of Iolaus, who applied a red-hot iron to the wound as soon as one head was cut off. The conqueror dipped his arrows in the gall of the Hydra, and all the wounds which he gave proved incurable.

hý-dra-zínes, s. pl. [Eng. *hydr(o)gen*; az(ote), and suff. -ines.]

Chem.: $\text{H}_2\text{N}-\text{NH}_2$. Hydrazine is not known in a free state. Its derivatives are obtained by the reduction of nitrosoamines by zinc dust and acetic acid, $(\text{CH}_3)_2\text{N}\cdot\text{NO}+4\text{H}$ (dimethyl-nitrosoamine)= $(\text{CH}_3)_2\text{N}-\text{NH}_2+\text{HOH}$ (dimethylhydrazine); also formed by the action of nascent hydrogen on nitrosodiethyl urea and diethylhydrazineurea. This compound, boiled with concentrated HCl in a water-bath, gives $\text{C}_2\text{H}_5\text{HN}-\text{NH}_2=\text{HCl}$, ethyl hydrazine hydrochlorate+ $\text{C}_2\text{H}_5\text{NH}_2\cdot\text{HCl}$ (ethylamine hydrochlorate)+ CO_2 . They are strong bases. A primary hydrazine has only one H substituted by an alcohol radical, as $\text{C}_2\text{H}_5\text{HN}-\text{NH}_2$. They reduce Fehling's solution in the cold. A secondary hydrazine has two H's substituted by alcohol radicals, as $(\text{CH}_3)_2\text{N}-\text{NH}_2$. They only reduce Fehling's solution when warmed. Aromatic hydrazines are formed in the same manner. $\text{C}_6\text{H}_5\text{N}\cdot\text{CH}_3\cdot\text{NO}+4\text{H}$ (nitrosomethyl aniline)= $\text{HOH}+\text{C}_6\text{H}_5\cdot\text{CH}_3\cdot\text{N}-\text{NH}_2$ (phenylmethyl hydrazine). An alcoholic solution of diazoamido-benzene, reduced by zinc dust and acetic acid, yields $\text{C}_6\text{H}_5\text{N}=\text{N}\cdot\text{NH}\cdot\text{C}_6\text{H}_5+4\text{H}=\text{NH}_2\cdot\text{C}_6\text{H}_5$ (aniline)= $\text{C}_6\text{H}_5\text{HN}-\text{NH}_2$ (phenyl hydrazine). Primary phenyl hydrazines are converted into diazo compounds by the action of mercuric oxide on their sulphates.

hydriodic-acid, s.

Chemistry: Hydric iodide, hydrogen iodide, HI. Hydriodic acid is a colorless gas forming in the air. At a pressure of four atmospheres at 0° it is condensed to a liquid. It can be frozen at ordinary temperature by a mixture of ether and solid CO_2 at a temperature of 55° . Its specific gravity is 4.3737, air=1. Hydriodic acid is prepared by the action of phosphorus and iodine in the presence of water, $\text{P}+5\text{I}+4\text{H}_2=5\text{HI}+\text{H}_3\text{PO}_4$. One part, by weight, of amorphous phosphorus is placed in fifteen parts of water, and twenty parts of iodine are added gradually. Then the flask is gently warmed, and the HI collected over mercury. H_2SO_4 does not liberate HI from potassium iodide; the reaction is $3\text{H}_2\text{SO}_4+2\text{KI}=2\text{KHSO}_4+\text{I}_2+\text{SO}_2+2\text{H}_2\text{O}$. Hydriodic acid is not combustible, and will not support combustion. It is decomposed by passing it through a red-hot tube, the gas becoming violet-colored. HI is very soluble in water. A solution kept cold by ice will have a density of 1.990. The solution decomposes in the air, water being formed and iodine liberated, which redissolves in the solution, turning it dark colored. A solution of HI in water dissolves Zn, iron ore, with evolution of H, forming iodides. An aqueous solution of HI can be formed by passing H_2S through water in which iodine is suspended, $\text{H}_2\text{O}+\text{H}_2\text{S}+\text{I}_2=2\text{HI}+\text{S}+\text{H}_2\text{O}$. A solution having the density of 0.7 can be prepared in this manner.

hydrobromic-acid, s.

Chem.: Hydric bromide, hydrogen bromide. Hydrobromic acid is a colorless gas, having an irritating smell, fuming in the air. It can be condensed into a colorless liquid at 73° ; it freezes at 87° . It is not inflammable, and extinguishes flame. It is very soluble in water. A solution of specific gravity, 1.486 contains 47 per cent. of HBr. The composition of the distillate changes with the pressure of the barometer. Bromine does not unite with hydrogen in the sunlight, nor by the electric spark nor by flame. Hydrobromic acid can be obtained by the action of concentrated phosphoric acid and potassium bromide; if sulphuric acid is used, a mixture of HBr, SO_2 , and Br_2 is obtained, but is prepared by placing one part, by weight, of amorphous phosphorus and two parts of water, and then ten parts of bromine are allowed to fall on it, drop by drop, from a tap funnel; then the flask is gently warmed, and the HBr is given off. It is passed through a U-tube containing amorphous phosphorus to free it from the vapor of bromine, and then it is collected in dry cylinders by displacement over mercury, $2\text{P}+5\text{Br}_2+8\text{H}_2\text{O}=10\text{HBr}+2\text{H}_3\text{PO}_4$. It can also be prepared by passing H_2S through a solution of bromine in water. Hydrobromic acid is decomposed by chlorine, $\text{Cl}_2+2\text{HBr}=\text{Br}_2+2\text{HCl}$. The hydrogen can be replaced by metals forming bromides.

hý-drô-car-bôn, s. [Pref. *hydro-* (2), and carbon (q. v.).]
Chem.: A name given to compounds of one or more atoms of carbon, with atoms of hydrogen. Carbon is a tetrad element, capable of uniting with four atoms of H, as CH_4 methane. But carbon atoms can unite with each other, by one or more pairs of bonds, thus $\text{C}=\text{C}$, $\text{C}=\text{C}=\text{C}$, $\text{C}=\text{C}=\text{C}=\text{C}$, the hydrocarbons having the C atoms united by only one pair of bonds are called paraffins, $\text{C}_n\text{H}_{2n+2}$, as ethane. Hydrocarbons having two C atoms united by two pairs of bonds are called olefines C_nH_{2n} , as ethene. By three pairs of bonds, are called acetylenes $\text{C}_n\text{H}_{2n-2}$, as acetylene $\text{HC}\equiv\text{CH}$. Besides these there are hydrocarbons belonging to the aromatic series, having the carbon atoms arranged to form a closed ring, as benzene C_6H_6 (q. v.), and the naphthalene series containing two closed rings. The constitution of the other groups of hydrocarbons are described under their respective names. [ANTHRACENE.]

 1. *Chem.*: HCl. Discovered by Priestley in 1772. It is a colorless, pungent, irritating gas, which destroys vegetation when liberated from soda works. It can be liquefied under a pressure of forty atmospheres at 10°. It is incombustible and extinguishes flames; it readily absorbs moisture, fuming in a moist atmosphere. It dissolves about 450 volumes of HCl at ordinary temperatures; the strongest solution has a density of 1.21, and fumes in the air; at 180° hydrochloric acid and water distill over, the distillate has the specific gravity of 1.1, and contains about 20 per cent. of acid. Hydrochloric acid is prepared by heating a mixture of twelve parts by weight of sodium chloride with twenty parts of H_2SO_4 and eight of water. Hydrochloric acid forms salts called chlorides. Hydrogen and chlorine unite directly when exposed to diffused daylight without condensation, forming hydrochloric acid, $\text{H}_2+\text{Cl}_2=2\text{HCl}$. The mixture explodes in direct sunlight.

hý-drô-çý-ân-ic, a. [Pref. *hydro-* (2), and Eng. *cyanic* (q. v.).]

hydrocyanic-acid, s.

Chem.: Cyanide of hydrogen, hydric cyanide, hydrogen cyanide, prussic acid. Discovered by Scheele in 1782. The pure anhydrous hydrocyanic acid can be prepared by passing dry H_2S over dry mercuric cyanide, gently heated in a glass tube connected with a small receiver cooled by a freezing mixture. It is a liquid which boils at 26.5°, and freezes at 15°. It is very poisonous, and smells like bitter almond oil. It easily decomposes. Heated with alkalis or acids it is converted into formic acid and ammonia. By the action of nascent hydrogen from zinc and hydrochloric acid it is converted into methylamine. An aqueous solution of HCN is best obtained by distilling powdered ferrocyanide of potassium with dilute sulphuric acid; a white residue of potassium ferrous ferrocyanide mixed with potassium sulphate remains in the retort. $2\text{K}_4\text{Fe}(\text{CN})_6+3\text{H}_2\text{GO}_4=6\text{HCN}+3\text{K}_2\text{SO}_4+\text{FeK}_2\text{Fe}(\text{CN})_6$. When the leaves of the cherry laurel, and cherries, are distilled with water, the distillate contains hydrocyanic acid. When a series of strong induction sparks are passed through a mixture of acetylene C_2H_2 and nitrogen, hydrocyanic acid is formed. Hydrocyanic acid is a weak acid, and forms salts called cyanides.

Phar.: Dilute acid is used to allay spasm. The dilute acid of the pharmacopœia contains two per cent. of HCN. Scheele's prussic acid contains four per cent. anhydrous. Hydrocyanic acid is the most rapid poison known; it causes death in a few seconds. The strength of a solution of HCN is determined by adding a solution of silver nitrate of known strength to a given volume of the HCN solution, to which excess of caustic soda has been added. The precipitate of AgCN is redissolved, on being well stirred, till all the hydrocyanic acid has been converted into a double salt of $\text{NaCN}\cdot\text{AgCN}$; afterward a precipitate of AgOH is thrown down, which does not redissolve. Each molecule of AgNO_3 represents two molecules of HCN.

hy-drô-gên, *s.* [Gr. *hydrô*=water, and *gennâo*=to generate, to produce.]

Chem.: Hydrogenium. A monatomic metallic element, which exists in the state of gas. Symbol H; atomic weight, 1; density, 0.06927; air being 1; weight of a liter of hydrogen, 0.0896 grammes, called a crith. Hydrogen can be obtained by the electrolysis of water, H_2O , the H being liberated at the platinum pole; by the action of metallic sodium and water; also by passing steam over iron filings, $3Fe + 4H_2O = Fe_3O_4 + 8H$; by boiling zinc with caustic potash, $2KHO + Zn = K_2ZnO_2 + 2H$; but H is generally made by the action of dilute H_2SO_4 on zinc. Hydrogen can be purified by passing it through a solution of two parts of $K_2Cr_2O_7$ in twenty parts of water and one part of H_2SO_4 , then washing it with KHO , and drying it by passing it through concentrated H_2SO_4 . The apparatus should be airtight and the gas rejected till the air is all displaced by hydrogen. Hydrogen is absorbed by red-hot iron and platinum; palladium absorbs 935 times its volume of hydrogen; about seven liters of gas are condensed into the space 1 c.c. Graham called this an alloy of hydrogenium, a metal having the specific gravity of 0.62 and magnetic properties. Hydrogen has been found occluded in meteoric iron, and is contained in the gases given off by volcanoes. The spectroscopic shows that a large quantity of free hydrogen exists around the sun. The spectrum of hydrogen contains four bright lines, a red arc corresponding to C, and a greenish-blue to F in the solar spectrum, and a blue and indigo line. Hydrogen has been condensed by Pictet, of Geneva, at a temperature of -140° , and at a pressure of 650 atmospheres. When the pressure is removed the hydrogen is evolved in a jet of a steel-blue color. Pure hydrogen is a colorless, odorless, tasteless gas; it is inflammable mixed with oxygen; it explodes in contact with a flame, or when the electric spark is passed through it, forming water. The calorific power of H is 34,462 thermal units. Hydrogen gas cannot support life, but it is not poisonous; it is slightly soluble in water. Hydrogen when kept in a bag for a long time is dangerous, owing to diffusion. One volume of hydrogen mixed with 25 volumes of air gives the loudest detonation. Hydrogen in the nascent state is used as a reducing agent in chemistry.

hydrogen-chloride, *s.* [HYDROCHLORIC-ACID.]

hydrogen-dioxide, *s.*

Chem.: Hydrogen peroxide, H_2O_2 , or $HO-OH$. Obtained by the action of dilute sulphuric acid and barium peroxide, BaO_2 . The barium peroxide is added gradually to a mixture of one part of H_2SO_4 and five parts of water till the solution is only slightly acid, the $BaSO_4$ is allowed to settle, and the clear liquid is concentrated by evaporation in vacuo. It can be obtained as a colorless oily liquid; it is decomposed by alkalis; it blisters the skin and bleaches litmus. At $60^\circ F.$ it gives off oxygen and bubbles; when boiled, oxygen is liberated so rapidly that it sometimes explodes. It is very soluble in ether. Finely-divided gold, silver, and platinum decompose H_2O_2 into water and oxygen; oxides of gold and silver are reduced to the metallic state, $Ag_2O + H_2O_2 = 2Ag + H_2O + O_2$. If a solution of H_2O_2 be acidified with H_2SO_4 , and ether and potassium chromate be added, the ethereal solution turns blue on being well shaken, owing to the formation of perchromic acid. Hydrogen-dioxide liberates iodine from KI in the presence of $FeSO_4$. A dilute solution of hydrogen-dioxide is used to clean stained engravings, and also to bleach dark-colored hair to a fashionable golden hue.

hydrogen-oxide, *s.* [WATER.]

hydrogen-persulphide, *s.*

Chem.: H_2S_2 , or H_2S_8 . A yellowish, oily liquid, which readily dissolves sulphur, therefore its composition cannot be determined. It is easily decomposed. It can be prepared by boiling for half an hour equal weights of slaked lime and flowers of sulphur with six parts of water, and then slowly pouring the deep orange filtered solution into dilute sulphuric acid; the mixture being stirred, a precipitate of sulphur and $CaSO_4$ is produced along with the oily hydrogen persulphide.

hydrogen-sulphide, *s.*

Chem.: H_2S , sulphide of hydrogen, hydric sulphide, sulphuric acid, hydrosulphuric acid, sulphuretted hydrogen. A gas obtained by passing hydrogen through sulphur, or by burning sulphur vapor in hydrogen. It is formed by the putrefaction of organic bodies containing sulphur; by allowing a soluble sulphate to remain in contact with decaying animal or vegetable matter, $CaSO_4 = CaS + 4O$, the oxygen uniting with the organic matter, the probable origin of sulphuretted springs. But H_2S is generally prepared by the action of eight parts water + one part H_2SO_4 , on ferrous sulphide, $FeS + H_2SO_4 = FeSO_4 + H_2S$; the water dissolves the ferrous sulphate. Pure H_2S is obtained by heating roughly-powdered antimony tersulphide with hydrochloric acid, $Sb_2S_3 + 6HCl = 3H_2S + 2SbCl_3$; the gas is

washed by passing it through water. Granulated zinc and fragments of native PbS acted upon with dilute HCl gives off a regular current of H_2S . Hydrogen-sulphide is a colorless inflammable gas, of a sweetish taste and odor of rotten eggs. It is a narcotic poison. It burns with a blue flame, forming water and SO_2 . A mixture of two volumes of H_2S and three volumes of oxygen explodes violently on sending an electric spark through it. (Chlorine decomposes it, the whole of the sulphur being separated; this is the best antidote to poisoning by H_2S . Water at 0° dissolves 4.37 volumes, at 15° 3.23 volumes of H_2S . The solution reddens blue litmus paper; it decomposes in the air, sulphur being deposited. H_2S in contact with a base and a moist atmosphere is partially converted into H_2SO_4 . At a pressure of seventeen atmospheres at 10° hydrogen-sulphide is reduced to a liquid, which boils at -81° ; it freezes at -85° . CO_2 liberates H_2S from a moist sulphide; the composition of H_2S can be shown by heating metallic tin in a given volume of the gas; the sulphur unites with the tin, and the hydrogen liberated occupies the same volume as the original gas. H_2S is used as a test for metals; if the sulphide is soluble in acids, it is not precipitated till the solution is neutralized, as free acid is liberated by the H_2S , as $ZnSO_4 + H_2S = ZnS + H_2SO_4$. The sulphides of the alkaline earths Ba, Sn, Cn, and Mg, and those of the alkalis are soluble in water.

1. **Zool.**: The typical sub-class of Hydrozoa. They have an alimentary region or polypite provided with an adherent disc or hydrorhiza and prehensile tentacles. Unlike hydra, the type of the sub-class, most of the hydroids live in societies, each of which constitutes a polypidom so like a seaweed that it is often collected as such. But while the apertures on an ordinary seaweed are only minute pores, the Hydroids have little cup-like cells along the stem and at the extremities of the branches, in which the individual polype lives. The cells have a small hole at the bottom, and the stock is hollow, so as to enable the individual polypes to remain part of a compound organism. The sub-class is divided into five orders, Hydrida, Corynida, Sertularida, Campanularida, and Thecomeduse. The Polyzoa or Bryozoa, once ranked with the sub-class, now figure as a distinct class, arranged under the subkingdom Molluscoida.

2. **Paleont.**: For the distribution of the Hydroids in time, see the different orders.

hỹ-drô-pă-thỹ, *s.* [Pref. *hydro-* (1), and Gr. *pathê*=a passive state of suffering.]

Med.: The water cure. The cure of diseases by the use of the warm bath, the cold bath, &c. Hippocrates, in the fourth century, B. C., and the Arabian physician Rhazes, in 920, advocated it. In medieval times it had followers first in Italy, then in Germany, and next in England, where it was recommended by Floyer (1649-1734). George Cheyne in 1725, Lucas in 1750, and Dr. Currie in 1797. Vincenz Preissnitz (1799-1851) systematized hydropathy, and, to a certain extent, made it popular. In his youth he was attacked and severely injured by

a horse, and had two of his ribs broken. He kept down the inflammation so successfully that, on his recovery, he began to prescribe water in other cases, and in 1825 set up a hydropathic establishment at Gräffenberg. Within twenty years at least 10,000 patients had been treated by him, and his system had become known in all civilized countries. Abstaining from venesection, then far too much employed, and from the use of purgatives, he prescribed water internally and externally, sweating, &c. As subsidiary aids open-air exercise, early hours, and cheerful society were recommended.

hý-drô-quin-ône, *s.* [Prefix *hydro-* (2), and quinone.]

Chem.: $C_6H_4(OH)(1-4)$. A para-diatomic phenol, obtained by dry distillation of quinic acid, or by heating an aqueous solution with plumbic dioxide, $C_6H_{12}O_6 + O = C_6H_4(OH)_2 + CO_2 + 3H_2O$; also from arbutin, which, when boiled with dilute sulphuric acid, yields hydroquinone and glucose. It has been obtained synthetically by heating para-iodo-phenol with potash to 180°; but it is easiest obtained by passing SO_2 into an aqueous solution of quinone, $C_6H_4 < O >$ till it becomes colorless; it is then evaporated, and the hydroquinone extracted with ether; also by oxidizing one part of aniline, eight parts of H_2SO_4 , and thirty of water, with two and a half parts of $K_2Cr_2O_7$. Hydroquinone crystallizes in colorless prisms, which melt at 169°, which can be sublimed, but if heated strongly it is decomposed. It is easily soluble in water, alcohol, and ether. Ammonia turns an aqueous solution of hydroquinone a red-brown color. Ferrichloride converts it into quinone.

hý-drô-stât-ics, *s.* [HYDROSTATIC.]

Physics: The department of science which treats of the conditions of equilibrium in liquids. For a liquid to remain at rest in any vessel, *first*, its surface must be everywhere at right angles to the forces which act on the molecules of the liquid, and, *second*, every molecule of the mass of the liquid must be subject in every direction to equal and contrary pressure. If the same liquid be placed in several vessels freely communicating with each other, it will stand in them all at the same horizontal level. If two or more liquids be placed in the same vessel they will arrange themselves according to their relative densities, after which the equilibrium will be stable. Pascal's law (a fundamental one in hydrostatics) is that pressure existing anywhere upon a mass of liquid is transmitted undiminished in all directions, and acts with the same force on all equal surfaces, and in a direction at right angles to those surfaces. In ancient times Archimedes and Hero of Alexandria made some advance in hydrostatics, as did Galileo (1564-1642), but, according to Hallam, the real creators of the science were Castellio (1577-1644), and Torricelli (1608-1647). It has since been greatly advanced.

Also by the action of hydrogen, obtained from tin and HCl on ammonium nitrate, or ethyl nitrate. The base is very volatile and easily decomposed; it is only known in solution. Hydroxylamine gives a light green precipitate with cupric sulphate, which is reduced to cuprous oxide on boiling with water. Hydroxylamine is a powerful reducing agent. Zoology:

1. *Sing.*: One of the Hydrozoa [2].

2. *Pl.*: The name given by Prof. Owen, followed by Professor Huxley, &c., to the great class of the sub-kingdom Coelenterata, of which Hydra is the type. They exhibit a definite histological structure, their tissues having a cellular organization. These tissues are two, an outer or ectoderm, and an inner or endoderm. The digestive cavity communicates directly by a wide aperture with the general cavity of the body. The digestive sac and the reproductive organs are developed as outward processes of the body-wall. In most the prey is seized by tentacles surrounding the mouth and furnished with offensive weapons called thread-cells. The Hydrozoa are all aquatic, and nearly all marine. Their distribution is world-wide. They are the Dimorpha of Ehrenberg, the Sertularians of Milne Edwards, and the Nudibranchiata of Farre. Prof. Huxley divided the class into three orders, Hydrophora, Siphonophora, and Discophora, doubtfully adding as a fourth the Trachymedusæ of Hæckel. Nicholson divides them into six sub-classes: Hydroida, Siphonophora, Lucernidæ, Discophora, Graptolidae, and Hydrocorallinae. (*Owen*, *Huxley*, *Nicholson*, &c.)

hý-ē-nā, **hý-ē-nā**, **hyene**, *s.* [Lat., from Gr. *haina*=a Libyan wild beast, probably the hyena, from *hus*=a swine, a pig, to which the hyena has no close affinity.]

1. *Zool.*: The typical genus of the family Hyenidæ (q. v.). The known recent species are four: (1) The common Striped Hyena (*Hyena striata*) is brownish-gray, darker above, with several irregular, transverse, distinct stripes along the sides. It is the *Canis hyena* of Linnaeus, the only species he knew. Inhabiting Western Asia and Northern and Central Africa, it was known to the ancients, who regarded it with superstitious awe, and invented many tales as to its habits. It is nocturnal, grubbing up corpses from graveyards, hunting down animals, or, in some cases, carrying off children. Moore calls its cry a "moan," but sometimes there is a sound like sardonic laughter, whence the animal is called the Laughing Hyena. Fierce as it is, it can be domesticated with ease. (2) *Hyena maculata*, the Spotted Hyena, found at the Cape of Good Hope, and in Southern Africa generally where it is called Cape Hyena, and, on account of its ferocity, Tiger-wolf. It is yellowish-brown, with numerous spots of a deeper color. It is somewhat smaller than the Striped Hyena. (3) *Hyena villosa*, the Strand Wolf of the Dutch, is also from the Cape, where it was first discriminated. It is grizzled

brown with some bands, whence it has been sometimes mistaken for the Striped Hyena [(1)]. (4) The Brown Hyena. It is found at Natal.

2. *Palæont.*: The genus first appears in the Upper Miocene of the Siwalik Hills and of continental Europe. It was well represented in the Pliocene. Prof. Boyd Dawkins reckons the Spotted Hyena, *Hyena crocuta*, one of the British Mid-Pleistocene mammals, existing to the late Pleistocene. Formerly the specimens from caves were named *Hyena spelæa*, but it is now believed that they are only a variety of *H. crocuta*. [ALBUM GRÆCUM.] When a cave like Kirkdale, or Kent's Hole, in England, once inhabited by hyenas, is opened, it is generally found to abound in bones of other mammals, which have been broken, gnawed, and polished by the teeth of the hyena.

Incisors 3, canines 1-1, premolars 3-3, molars 3-3, the last molar in the upper jaw being tubercular, as in the Felidæ, and the tongue, as in these case, rough with prickles. They have projecting eyes and large ears. In their claws, which are not retractile, they approach the Canidæ (Dogs), but the toes are only four, while in both the cats and dogs they are five. The hind feet of the hyenas are much bent, making the shoulder higher than the haunch. The body is heavy, and the gait stooping. The whole organization adapts them for breaking bones. [HYENA.] They inhabit the warmer regions of the Old World. Southern Africa being their metropolis. In addition to Hyena, the genus *Proteles*, though it has viverrine affinities, seems to belong to this family. [AARDWOLF.]

hygrometric-balance, s. An instrument for indicating the relative density of the air, and consequent changes of rain or dry weather. It consists of a balance, from one arm of which is suspended a brass weight, and from the other a large, thin, hollow cylinder, closed at each end. The two are arranged so as to be in equilibrium at a given density of the atmosphere, and it is evident that if the air become heavier, the large cylinder, displacing more air than the solid weight, will become more buoyant and ascend. If, on the contrary, the air become lighter, it will sink. A rod descending from the scale-beam serves to indicate, on the graduated arc below, the comparative density of the air at the time of making the observation. If the air be heavy, fine weather may be expected; but if the cylinder sink, rain usually follows.

hygrometric-plants, s. pl.

1. A song or ode in praise, honor, or adoration of God, or some deity; a sacred song.

2. *Spec.*: A sacred composition in poetry intended to be sung with or without the aid of a musical instrument, and not being versified from the book of Psalms, else it is called a Psalm, or directly from any other part of Scripture, or else it is a paraphrase. Hilary, Bishop of Arles, is said to have composed the first hymn for Christian worship about A. D. 431, but as early as the time of Pliny the Younger the Christians are said to have habitually sung one to Christ as God. On Dec. 9, 633, the Council of Toledo sanctioned the use of hymns in churches. Luther did much to popularize hymnody in the infant Protestant Church in Germany. Of the hymns now in use many were composed by Isaac Watts, Charles Wesley, John Wesley, and Cowper. Many devotional English hymns are translations from the German, or from the Latin and Greek hymns of the early or of the medieval Church. Prominent among Americans who have written hymns are Oliver Wendell Holmes, Phoebe Cary, P. P. Bliss, Ira D. Sankey, Julia Ward Howe who wrote "The Battle Hymn of the Republic," and Samuel Francis Smith, author of the national hymn "America."

Math.: One of the three conic sections. It is a plane curve of such a form that if from any point in it two straight lines be drawn to two given fixed points, the excess of the

straight line drawn to one of the points above the other will always be equal. The two points are called the foci. If a cone be cut by a plane in such a direction that the plane cuts the base at a greater angle than the side of the cone makes, a hyperbola will be generated. If two cones, A and B, placed apex to apex, be both cut by a plane *abc, d*, the hyperbolas, *xyy, p q*, will be generated with their convexities turned to each other. If a straight line be drawn from the foci and then bisected, the point of bisection is called its center. The distance from either focus to the center is its eccentricity. Any straight lines drawn through the center and terminated by two opposite hyperbolas is called a diameter. The point where it cuts the hyperbola is its vertex. The diameter which passes through the foci is called the axis major, or principal axis. An axis minor, or minor axis, can be constructed at right angles to the first. Other terms used of the hyperbola are abscissæ, parameter, *latus rectum*, directrix, and a term peculiar to it, asymptotes (q. v.).

1. H_2SO_2 ; by the action of Fe or Zn on sulphurous acid H_2SO_3 , contained in a closed vessel, a yellow solution of zinc hyposulphite is obtained. Nearly pure NaHSO_2 is obtained by dissolving zinc in a concentrated solution of acid sodium sulphite, NaHSO_3 . A double salt of zinc and sodium sulphite first crystallizes out, then alcohol is added to precipitate the rest of this salt, and the decanted liquid is placed in a well-corked flask, and colorless needles of sodium hydrogen hyposulphite, NaHSO_2 , crystallize out. The solution has bleaching properties. The free acid is liberated by oxalic acid, giving an orange solution, which bleaches strongly and decomposes in the air.

A branch of it could be used like a sponge to take up a liquid (Exod. xii. 22). It had, at least ceremonially, if not even actually, detergent properties (Lev. xiv. 6, 49, 51, 52; Numb. xix. 6, 18). It was the symbol of spiritual purification from sin (Ps. li. 7). The passages in 1 Kings and Exodus suggest moss. But the probability is in favor of the view that the plant is the caper (*Capparis spinosa*), the *asuf* of the Arabs, a climber among rocks, rooting in the fissures.

(2) New Test.: In Heb. ix. 19, 21, the Old Testament *ezob* is rendered by the Gr. *hysopos*. If the hyssop of John xix. 29 furnished the stick to which the sponge was affixed, and was not itself the sponge, then moss would not answer the description, but the caper plant would [1].

THE ninth letter, and the third vowel in the English alphabet. It has two principal sounds: (1) a long sound, as in *bind*, *find*, and in all words of one syllable ending in *e*, as in *fine*, *wine*, &c.; (2) a short sound, as in *fin*, *bill*, *fill*, &c. Besides these it has also three minor sounds: (1) as in *dirk*, *first*, &c.; (2) the French sound, as in *intrigue*, *machine*, &c.; and (3) the consonantal sound of *y*, when followed by a vowel, as in *Christian*, *million*, &c. It is uttered with a less opening of the mouth than *e*, the tongue being brought back to the palate, and striking the teeth next the cheek plate. With *a* and *e*, *i* makes several digraphs, as in *wait*, *neigh*, *field*, *seize*, *friend*; with *o* it forms a proper diphthong, as in *oil*. *A*, *i*, and *u* are by philologists called the primitive vowels, and from them all the various vowel sounds in the Aryan language have been developed. As a prefix, *i* was used in Middle English to represent the A. S. *ge*, as in *iwis*=*gewiss*. No true English word ends in *i*, its place as a final vowel being taken by *y*. *I* and *j* were formerly regarded as one character, and in dictionaries up to a comparatively modern date words beginning with these letters were classed together.

3. An ice-cream (q. v.).

4. An article of commerce manufactured of a mixture of fruit extracts, water and sugar, sold in a congealed state.

¶ To break the ice: To make the first attempt or effort in any direction.

II. Technically:

1. *Chem. & Min.*: Water congealed so as to be rendered solid by cold. *Dana* ranks water as a mineral species, and notes that its crystals are hexagonal and occur usually in compound stellate forms. Ice is transparent owing to the close contact of the crystals which compose it: this makes the individual particles so blend as to render the mass optically, as well as mechanically, continuous. Its specific gravity is 0.914. Water freezes at 32° of Fahr., at zero (0) of Centigrade. Its greatest density is at about 40° F., 4° or 5° C., hence ice floats on water. The surface of sheets of water is frozen while their mass remains liquid. Ice one inch and a half thick will support a man; four inches thick will support cavalry; five inches thick will support an eighty-four pound cannon; ten inches thick will support a multitude; eighteen inches thick will support a railroad train.

2. *Meteor.*, *Physical Geog.*, *Geol.*, &c.: Ice exists at all seasons, both on land and on the ocean around the Northern and Southern Poles, and in all latitudes on mountain tops; it occurs in winter, in most countries, by the freezing of lakes, ponds, streams, &c. Some of the forms in which it is found are ice-fields, icebergs, &c. (q. v.). Its action is the key to explain many geological phenomena [ICE-AGE, &c.] In some places, as in *Siberia*, it has been found interstratified with sand, or, as in *New South Shetland*, with volcanic ash.

3. *Manuf. & Comm.*: The Greeks and Romans were able to make artificial ice. Walker, in 1782, Leslie, in 1810, and Harrison, in 1857, invented or patented processes for the purpose. In 1806 Tudor, of Boston, began to export ice in quantities. The French followed in 1857.

4. *Therap.*: It is used as a remedy or palliative in hernia, hemorrhage, inflammation of the brain, &c.

When the body falls to 32° F., the freezing point, it is wiped clean, as is the cavity itself, with a cloth previously weighed. Ice-bërg, s. [Eng. *ice*, and *berg* (q. v.).]

Ord. Lang. & Geol.: A hill of ice which is either floating in the ocean or has somewhere taken the ground. The genesis of an iceberg is generally on the shore; it exists first as a glacier (q. v.) but when this in its onward progress reaches the cliffs and slides down them into the ocean, it loses the name of glacier and takes that of iceberg. Scoresby counted 500 of them drifting between lat. 69° and 70° N. The magnitude of some icebergs is very great. Capt. Sir John Ross saw several of them together in Baffin's Bay aground in water 1,500 feet deep. One seen off the Cape of Good Hope was two miles in circumference and a hundred and fifty feet high. Others were from 250 to 300 feet above the sea. For every cubic foot above there must be at least eight below. The rotation of the earth makes the icebergs which escape from the North Polar regions in proximity to Europe drift partly to the westward and they rarely reach Britain, though Cowper has a poem "On the Ice-islands seen floating in the German Ocean, March 19, 1799." Many impinge upon the eastern shores of Iceland; escaping that island they are borne away in the direction of the eastern shores of America. They do not approach the equator nearer than about 40° N. and 36° to 39° S. When an iceberg reaches a coast and melts, it generates chilling fogs, and so reduces the temperature as temporarily to deteriorate the climate of the adjacent land. They carry with them earth, rocks, &c., obtained when they were in the glacier state. These, when the ice melts, fall to the bottom of the sea and form moraines. When they scrape their way over the bed of the ocean they score the several rocks over which they pass. They often transport animals and seeds of plants to great distances. Ich-neu-môn'-l-dæ, s. pl. [Latin *ichneumon*; fem. pl. adj. suff. -idæ.]

Entom.: Ichneumon-flies, cuckoo-flies; a family of Hymenopterous insects, sub-tribe Pupivora of Latreille, now often called Entomophaga. Once made to contain the whole of that tribe, it is now limited to species which have straight antennae, and the abdomen attached to the extremity of the metathorax. Like other entomophaga, they lay their eggs in the bodies or eggs of other insects; these hatching produce larvae which devour the egg or the animal, whether immature or mature, in which they were developed. When a caterpillar is attacked, the larvae of the ichneumon feed on its fat, avoiding all destruction of the alimentary canal; the animal is sickly, but is able to go into the chrysalis state; instead, however, of a lepidopterous insect emerging, there come forth multitudes of small ichneumons. I. Ord. Lang.: A mental image, form, or representation of anything.

¶ In popular language *idea* is used as a synonym for opinion, belief, purpose, or intention; and in the example it has the sense of mental powers.

"To teach the young idea how to shoot."

Thomson: *Spring*, 11.

II. Philos.: The word *idea* has been taken in very many and very different senses, the history of which would be a history of philosophy. The idea of Plato (B. C. 429-347) is the pure archetypal essence in which things subsumed under the same concept participate; Aristotle (B. C. 384-322) taught that though the One, apart from and beside the many, does not exist, none the less must a unity be assumed as (objectively) present in the many; and the Stoics (Zeno, circ. B. C. 355-263) maintained the doctrines of subjective concepts formed through abstraction. Philo, who flourished about the middle of the first century, transformed the Platonic ideas into divine thoughts, having their seat in the Logos, and says, "This is the doctrine of Moses, not mine." According to Plutarch of Chæroneia (toward the end of the first century), the ideas were intermediate between God and the world; they were the pattern and God the efficient cause. For Plotinus (203-270) the primordial essence was elevated above the Platonic ideas, which were emanations from the One. St. Thomas of Aquin (1227-1274), recognizes a form in which the universal exists before things—viz., as ideas in the divine mind. For Descartes (1596-1650), "ideas are the forms of things received into the soul;" for Spinoza (1632-1677) the "concepts formed by the mind as a thinking thing;" and Locke (1632-1704) says, "whatsoever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call an idea." In the philosophy

of Leibnitz (1646-1716) ideas are the active forces of his monads; Berkeley (1684-1753) used the word as equivalent to phenomenon; Hume (1711-1776) defines ideas as "copies of perceptions," and Condillac (1715-1780) as "mental representations of objects of apprehension." Kant (1724-1804) gives the name of ideas to those "necessary conceptions of the reason for which no corresponding real objects can be given in the sphere of the senses." According to Erasmus Darwin (1731-1802), an idea is a "contraction, or motion, or configuration of the fibers which constitute the immediate organs of sense." Romagnosi (1761-1835) rejects the notion that ideas are only transformed sensations; he recognizes in the mind a specific logical sense, to which he attributes the formation of universal ideas and ideal synthesis. [For the views of Fichte, Schelling, and Hegel, see IDEALISM.] James Mill (1773-1836) calls ideas "what remain after sensation has gone," and Herbart (1776-1841) "typical conceptions." Schopenhauer (1788-1860) posits as intermediate between the Universal Will and the individual in which it appears, various ideas as real species forming stages in the objectification of the Will.

i-dē-āl-ism, s. [Eng. *ideal*; -ism; Fr. *idéisme*; Ger. *idealismus*.]

Philos.: The name given to certain systems which deny the individual existence of object apart from subject, or of both apart from God or the Absolute. (*Larousse*.) Idealism denies the existence of bodies, holding that their appearances are merely ideas [perceptions] of the cogitant subject. Subjective idealism teaches that these ideas are produced by the mind; objective idealism that God is their author. To these two hypotheses all idealism may be reduced. Zeno of Elea, in classic times, anticipated modern idealism. The teaching of Zeno underwent many changes, till it appeared in the modified idealism of Plato, which was itself, in course of time, repeatedly added to or diminished. Berkeley [IMMATERIALISM] developing Locke, Descartes, Spinoza, and Leibnitz did much to revive idealism. Kant has been claimed as an idealist—Franck (*Dict. des Sciences* (1875), 757a) makes Kant's *idéalisme subjectif* one of the three divisions to which he refers all modifications of Ideal philosophy; but Lewes (*Hist. Philos.*, ii. 543) says Kant "never overlooks the distinction between the phenomena which the mind fashions, and the noumena which it only postulates." Fichte, Schelling, and Hegel are the founders of the great schools of German Idealism, called respectively, Subjective, Objective, and Absolute. For Fichte the object has no real existence, but is dependent upon the subject; the non-Ego is the product of the Ego (the human soul). For Schelling object and subject are equally real, and equally manifestations of the Ego (in his system the Absolute, the Substance of Spinoza). Hegel's only reality in this case is the relation between the Ego and non-Ego. [HEGELIANISM.]

Id-ē-ōl-ō-gŷ, *s.* [Fr. *idéologie*, from Gr. *idea*, and *logos*=a discourse.]

Hist. & Philos.: A term introduced by Destutt de Tracy in his *Eléments d'Idéologie* (1801-4) to designate the philosophy of the French Sensational School. The mind, according to de Tracy, is nothing but sensation, or more properly the sensibility of which sensation is the exercise. This sensibility is susceptible of impressions arising (1) from the present action of objects upon its organs, when it feels simply; (2) from past actions, when it repeats or recollects; (3) from things which have relations, and so may be compared, when it judges; and (4) from the wants of the individual, when it wills. Thus sensation, according to the nature of its objects, manifests itself as pure perception, memory, judgment, or will. The word has now come to have a more extended meaning, and its use is not confined to a particular school.

3. Excessive veneration for or attachment to any person, object, or thing. (Shakesp.: *Two Gentlemen of Verona*, iv. 4.)

¶ According to Sir John Lubbock, idolatry or anthropomorphism is the fifth of six progressive stages in the history of religion. [GOD.]

(1) *Ethnic*: The ancient Egyptians, the Greeks, and the Romans, the modern Chinese, Burmese, Hindus, &c., are all in that fifth stage of religious development.

(2) *Jewish*: In all countries where idolatry exists, the tendency is for the uneducated to worship the idol as if it were a deity, while the more enlightened employ it simply as an imagined aid in adoring an unseen God. Many of the denunciations against idolatry in Isaiah's prophecies are leveled chiefly at the first of these (xlii. 17, xlv. 10-17); but some censure also the higher form (xl. 18-25). When Aaron made the golden calf, he proclaimed a feast, not to it, but to Jehovah. This was on his part the higher form (Exod. xxxii. 4, 5), but the people said, "These be thy gods," and worshiped the calf itself (xxxii. 4, 8). The second commandment is directed against idolatry.

(3) *Christian*: Images had been introduced into the various churches about A. D. 300 for instruction only: gradually they began to be worshiped. About 726 a controversy arose with regard to their use. The Emperor Leo the Isaurian issued edicts against them, and carried them out with relentless rigor in 726. Between the doll of a girl and the idol of a worshiper there is a close affinity, and it is a noteworthy fact that the restoration of image-worship was brought about by the Empress Irene in 780. The second Council of Nice sanctioned them in 787. But in the modern Greek Church, pictures instead of actual images are used. The latter are employed in the Roman Catholic Church. Most Protestant Churches exclude them from their places of worship, or, if they admit them, do so only for ornament. [ICONOCLAST.]

Its composition is generally ascribed to Homer of whose parentage, birth, and life nothing is known for certain. It is, however, a matter of dispute as to whether the poem is a homogeneous whole, or a series of ballads or rhapsodies on different episodes in the Trojan War, united into a continuous poem. It is further doubtful whether, in the latter case, the union was made by Homer himself, or by some person after his time. It is said that Pisistratus, tyrant of Athens, first collected and arranged the *Iliad* and *Odyssey* in the form in which we now have them. The chief subject of the poem is the wrath of Achilles, and the consequent troubles thence arising, whence we have the phrase *Ilias malorum*=an Iliad of woes or troubles, a world of disasters. The action of the poem is confined to the tenth and last year of the siege of Troy.

It crystallizes in the form of yellow microscopic needles, which melt at 198°, and are decomposed at 215°. They rejected the sacraments, and held that by mental prayer they might attain such perfection as to dispense with good works, and that they might commit any crime without sin. Ignatius Loyola, while a student at Salamanca (1527), was tried by an ecclesiastical commission for sympathy with the views of this sect, but declared innocent.

The Rosicrucians (q. v.) were so called, but generally by this title are designated the members of a society formed at Ingolstadt, in 1776, by Adam Weishaupt, Professor of Canon Law, and an ex-Jesuit. It had some resemblance to, and received substantial support from, Freemasonry, and many educated men of liberal views joined it. Its objects were religious and political emancipation, its ideal form of government republican, and its religion deistic. Espionage and a kind of confession, which Weishaupt's experience among the Jesuits led him to adopt, caused dissensions. The Baron von Knigge, one of the principal members, quarreled with Weishaupt; the order was suppressed by edict, March 2, 1785, and Weishaupt was degraded and banished. The Illuminati were supposed to exercise great political influence; but it is now believed that the views of Barruel and Robison on that subject were exaggerated.

¶ *Imitation* is the generic copy, and *counterfeit* the specific: to *imitate* is to take a general likeness; to *copy*, to take an exact likeness; to *counterfeit*, to take a falselikehood; to *imitate* is, therefore, almost always used in a good or an indifferent sense; to *copy* mostly, and to *counterfeit* always, in a bad sense; to *imitate* an author's style is at all times allowable for one who cannot form a style for himself. To *imitate* is the general term: to *mimic* and to *ape* are both species of vicious imitation. One *imitates* that which is deserving of imitation, or the contrary: one *mimics* either that which is not an authorized subject of imitation, or which is imitated so as to excite laughter. A person wishes to make that his own which he *imitates*, but he *mimics* for the entertainment of others. Immaculate Conception, *s.*

Roman Theol. & Ch. Hist.: The dogma defined by Pope Pius IX., on Dec. 8, 1854, that the immaculate conception of Mary is an article of divine faith. According to the dogma, in her active conception, or generation, there was nothing miraculous; but in the passive conception, or infusion of a rational soul, she was sanctified and preserved from the taint of original sin by the foreseen merits of Christ. The traditional day of Mary's conception has been honored with a feast from the twelfth century, and found a place in the calendar in the fourteenth. In the fifteenth century, all doctors of Paris were bound to defend the doctrine, which

was warmly adopted by the Franciscans and Carmelites, while the Dominicans, naturally following St. Thomas of Aquin, held the contrary view. The Council of Trent expressly excepted Mary from the decree *De Peccato Originali*, adopted in the fifth session (June 17, 1546).

¶ The Constitution of the United States provides that the House of Representatives shall have the sole power of impeachment (Art. I, Sec. 2, Cl. 5); and that the Senate shall have the sole power to try all impeachments (Art. I, Sec. 3, Cl. 6). Section 4 of Article II. provides that the President and

Vice-President and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery, or other high crimes or misdemeanors.

"The removal of Federal officers by impeachment proceedings under Section 4 of Article II. of the Constitution has been attempted seven times.

"The Blount case was the first. William Blount, United States Senator from Tennessee, was charged in 1797 with conspiring with British officers to steal part of Louisiana from Spain for England's benefit. The House prepared articles of impeachment. The Senate expelled him, after putting him under bonds for trial. Blount's defense was that a Senator was not a civil officer liable to impeachment, and on the question of jurisdiction only he was acquitted.

"Judge John Pickering, of the Federal District Court for New Hampshire, was impeached in 1803 for drunkenness and profanity on the bench. The defense was insanity. On trial before the Senate, Pickering was convicted by a party vote, and removed from his office.

"In 1804, Samuel Chase of Maryland, a Justice of the Supreme Court of the United States and one of the signers of the Declaration of Independence, was charged with improper conduct on the bench; among other things, with having indulged in 'highly indecent and extrajudicial reflections upon the United States Government' in the course of a charge to a Maryland Grand Jury. The impeachment proceedings, instigated and managed by John Randolph of Virginia, were political in their origin and animus. Judge Chase was acquitted through the failure of the prosecution to obtain a two-thirds vote against him in the Senate, on any one of the eight articles of impeachment. He resumed his seat on the bench, and held it as long as he lived.

"About a quarter of a century later, James H. Peck, a Federal District Judge in Missouri, was impeached for oppressive treatment of an attorney. The case was of no importance; the Judge was acquitted.

"Thirty years afterward, at the beginning of the war of the rebellion, Judge West H. Humphreys of the Federal District Court of Tennessee, joined the Confederacy and accepted judicial office under it, without taking the trouble to send his resignation to Washington. He was impeached, mainly in order to vacate the office, and convicted on June 26, 1862. One of the witnesses summoned to appear against Judge Humphreys was Andrew Johnson, then Governor of Tennessee, destined himself to be the next subject of impeachment proceedings before the Senate. One of the Federal Senators who voted not guilty on the article charging Judge Humphreys with high treason, was William Pitt Fessenden, whose vote five years later saved Andrew Johnson.

"Andrew Johnson was impeached on March 4, 1868, the eleven articles charging the President in various forms with violation of the Tenure of Office act, with violation of the Constitution, with conspiracy to prevent the execution of the Tenure of Office act, with conduct and utterances tending 'to bring the high office of President into contempt, ridicule, and disgrace;' and with the public declaration, in his speeches while swinging around the circle, that the Thirty-ninth Congress was no constitutional legislature. It is not necessary to recite the historical details of the case, which lasted for nearly three months, and in which the hottest of political passions were enlisted. Thirty-six votes were needed to convict. No vote was ever taken except on the three strongest articles, the second, third, and eleventh, and on each of these the Senate stood 35 for conviction to 19 for acquittal, impeachment failing by a single vote. One of the counsel who defended President Johnson was the Hon. William M. Evarts of New York.

"The seventh and last Federal impeachment was that of William W. Belknap, Grant's Secretary of War. He was justly charged in 1876 with corruption in office, and the House voted unanimously to impeach him. He resigned hastily a few hours before the passage of the impeachment resolution, and his resignation was promptly accepted by Grant. The trial proceeded, nevertheless. Belknap's defense was a denial of jurisdiction, based on the circumstance that when the impeachment resolution passed the House, he had ceased to be a civil officer of the United States. The impeachment proceedings failed by the lack of a two-thirds majority in the Senate for conviction.

"It will be observed that in only two cases have impeachment proceedings against a civil officer of the United States been prosecuted successfully before the Senate by the House of Representatives. One of these was for the removal of a running and profane judge, whose presence upon the bench was a public scandal. The other was a purely formal proceeding to vacate the office of a judge actually engaged in open rebellion against the Government, but technically still an incumbent of his office under the Government. Of the five unsuccessful impeachment proceedings on record, two failed for want of jurisdiction. Of the whole seven cases, four concerned judicial officers. Only once has there been an attempt to punish by impeachment a Cabinet officer. Only once has there been an attempt to punish and remove by impeachment a President of the United States."—*New York Sun*, Dec. 24, 1893.

4. The state of being impeached; a charge, an accusation, an indictment.

"The fears of the patricians lest they should be made the subjects of vindictive *impeachments*."—*Lewis: Cred. Early Rom. Hist.* (1856), ii. 283.

5. The act of bringing discredit upon or calling in question the credibility, purity of motives, uprightness, correctness of a person or act; as, the *impeachment* of a witness, or the *impeachment* of a person's motives.

The find and wood on one side are pared away about three inches in length, as is the stock or branch in the place where the graft is to be united; a little tongue is cut upward in the graft, and a notch made in the stock to admit it, to prevent their slipping, and for better union. The joint is clayed or waxed as usual. After four months the graft may be cut from the mother tree, sloping it off close to the stock. The operation is always performed in April or May, and is commonly practiced upon oranges, myrtles, jasmines, walnuts, firs, and pines, which will not succeed by common grafting or budding."—Miller: *Gardener's Dict.*

(1) *Ethnic*: Sir G. Birdwood (in *Encyc. Brit.*, ed. 9th, xii. 718, sqq.), considers that religious censuring of persons and things grew out of purificatory fumigation. Tylor (*Prim. Cult.*, 1873, ii. 383) is of opinion that incense is the natural outcome of animism, which might reasonably hold that offerings reduced to smoke or vapor by the medium of fire were fittingly consumed by or transmitted to spiritual beings. (Cf. Genesis viii. 21; Hom. *Il.* i. 317; Ovid, *Met.*, xii. 154.) An inscription in the alley of Hammamat states that an Egyptian nobleman was sent by Pharaoh Sankhara (B. C. 2500) "to bring back odoriferous gums" from Punt, now identified with the Somali country; the marbles of Nineveh furnish examples of offering incense to the Sun-god (2 Kings xxiii. 5); and the Hindus employed it from the remotest antiquity. The progress in classic times from "fumigations with herbs and chips of fragrant wood" is shown in the *thyos* (cf. *thyos*) of Homer, and the *libarotos* of later writers; in the *herbe Sabine* and *laurus* of Ovid (*Fast.* i. 343, 344), and the *mascula thura* of Virgil (*Ecl.* viii. 65).

(2) *Jewish*: *Qetoreth*, *qetorah*. This is sometimes confounded with *lebonah*, frankincense, which is the name of a plant. Incense was compounded of stacte, onycha, galbanum, and pure frankincense, an equal part of each by weight. Any one making a similar composition was to be cut off from the people of God. (Exod. xxx. 34-38.) Incense was to be burnt every morning and evening on the "altar of incense." (Exod. xxx. 7, 8.) On the great day of atonement a handful of it, put on a censer of burning coals when the priest went within the veil to the Most Holy Place, was to rise in a cloud covering the mercy seat (Lev. xvi. 12, 13). It was used also on extraordinary occasions, at times of great public calamity, as plague (Num. xvi. 46-50). Only the priests might burn incense (2 Chron. xvi. 12-13; Luke i. 8, 9). Probably it symbolized the acceptable prayers of saints (Psalm cxli. 2; Rev. viii. 4).

(3) *Christian*: In the Roman and Greek Churches it is used in all the solemn offices. It is mentioned in the first *Ordo Romanus*, probably of the seventh century. It is also used in the Catholic and Apostolic Church. [IRVINGITES.] In the Anglican Church the use of incense was gradually abandoned after the reign of Edward VI. until the ritualistic revival of the present day; but it has never been formally prohibited. Neither the Reformed Churches of Europe nor English Protestant dissenters employ incense in their ritual.

Cicero (*de Div.*, ii. 59) jestingly asks why this power should only be exercised by *Æsculapius* and *Serapis*, and not by other divinities.

Dei* (xv. 23); in the Middle Ages it was fully accepted by theologians and lawyers, and scores of women were burnt for an impossible crime. How long a belief in incubi lingered in England may be seen in Burton's *Anat. of Melancholy* (pt. iii., § 2, mem. 1), where copious references are given; and Leuret (*Fragments Psychologiques* (Paris, 1834), p. 257) may be consulted for the views of St. Bernard and those of the physicians of La Salpêtrière on the subject. indeterminate-coefficients, s. pl.

Math.: A method of analysis invented by Descartes, the principle of which consists in this, that if we have an equation of this form—

$$A + Bx + Cx^2 + Dx^3 + \&c. = 0,$$

in which the coefficients A, B, C, D, &c., are constant, and x a variable quantity, which may be supposed as small as we please, then each of these coefficients taken separately is necessarily equal to 0.

indeterminate-equation, s.

Math.: An equation is indeterminate when the unknown quantities which enter it admit of an infinite number of values; the equation of the right line is an example of an indeterminate-equation; in general, most of the equations used in analysis are indeterminate. Whenever an equation contains more than one arbitrary or unknown quantity, that, considered by itself, is indeterminate, for any number of sets of values may be attributed to all the unknown quantities, except one, and the value of that one deduced. A group of equations containing more unknown quantities than there are equations is indeterminate.

indeterminate-inflorescence, s.

Bot.: The same as INDEFINITE-INFLORESCENCE (q. v.). (Gray.)

indeterminate-problem, s.

Math.: A problem is indeterminate when it admits of an infinite number of solutions. This will always be the case when there are fewer imposed conditions than there are unknown or required parts; for, in that case, the equations which express the imposed conditions will be fewer than the number of unknown quantities which enter them; consequently, they will be indeterminate, and of course the problem itself will also be indeterminate.

indeterminate-quantity, s.

Math.: A quantity is indeterminate when it admits of an infinite number of values. In the equation of a straight line, $y = ax + b$, x represents the abscissa of any point of the line, and is indeterminate when considered only with reference to its value; when considered with reference to its connection with y, it is independent of it, provided we agree to assume it as the independent variable. [INDEPENDENT.]

Math.: A series whose terms proceed by the powers of an indeterminate quantity.

Index-prohibitorius, s.

Ch. Hist.: A list of books which may not be read by Roman Catholics, cleric or lay, on pain of excommunication. Livy (xxxix. 16) testifies to the practice of burning books of magic in pagan Rome, and the Ephesian converts who used "curious arts" voluntarily did the same (Acts xix. 19). Prior to the invention of printing, there were many cases in which the Roman Pontiffs had suppressed the writings of authors whom they judged heretical. The Council of Constance (1415) ordered the books of Huss to be burnt, and Leo X. condemned the writings of Luther. In the seventeenth session (Feb. 26, 1562) of the Council of Trent a commission was appointed to compile an Index of Prohibited Books and a code of general rules on the subject. Indian-architecture, s.

Arch.: The architecture existing in, and to a certain extent peculiar to, India. No remains exist earlier than the third century B. C., when the Emperor Asoka made Buddhism the religion of India. After that period there arose (1) Buddhist architecture (q. v.), followed by (2) Jaina architecture (q. v.). Of styles more distinctively Hindu there were four—viz., (3) the Southern, (4) the Northern, and (5) the Modern Hindu; and (6) the Cashmirian. Temples, &c., of the Southern Hindu style exist within the area formed by a line drawn east and west from Madras to Mangalore, constituting a triangle having each side 400 miles. The chief race is the Tamul. The temples are divided into a square Viman (the temple proper), with a pyramidal roof of one or more stories, Mantapas (porches), Gopuras (gate-pyramids), and Choultries (pillared halls). The most splendid example is the temple at Tanjore, its base being a square of 82 feet; the height, two stories; the pyramidal roof, fourteen; the height, 180 or 200 feet. The Kylas of Ellora is of the Southern Hindu style. The Northern Hindu is rarer, and is of Aryan origin. The finest temples are in Orissa, especially Bobaneswar, built about A. D. 657. They have a curved spire, sometimes surrounded by other spires. The Modern Hindu style is this ancient one modified by Mohammedan styles. The Cashmirian type of temple has two or four roofs and dormer windows; and in some cases has pillars like Doric, the legacy perhaps of the old Greek Bactrian kingdom. There is also a trifoliate arch of unknown origin. (Fergusson: *Architecture*) [TEMPLE.]

punished as in the states. Oklahoma is the name of a tract of land in the northern part of Indian Territory. It contains between 5,000,000 and 6,000,000 acres of land. This Oklahoma tract was ceded to the United States by the Creeks and Seminoles in 1866, and by the terms of the cession it was distinctly stated that the land was given "in compliance with the desire of the United States to locate other Indians and freedmen thereon," and it was stipulated that it was to be "used as homes for such other civilized Indians as the United States may choose to settle thereon." The name is of Indian derivation. The opening of Oklahoma (1889) was signaled by a rush of settlers unparalleled in the history of the country. It is extracted from the dried leaves with alcohol, the resulting greenish tincture being allowed to evaporate spontaneously. The residue is next treated with water, filtered, and the filtrate shaken with cupric hydrate, and again filtered. On the removal of the copper by means of sulphuric acid, the clear solution is found to contain almost pure indican. It is soluble in water, alcohol, and ether, and on boiling with dilute acids it is decomposed into indigo-blue and indigluin. It cannot be dried without decomposing. Indican is sometimes found in the urine of man, both in health and disease. It has also been found in the blood of man, and in the blood and urine of the ox.

2. *Chem.*: A reagent used in volumetric analysis to indicate, by change of color, the exact point at which the precipitation of any chemical body from a solution is completed. Thus, in estimating the amount of hydrochloric acid present in a solution, a standard solution of silver nitrate is used, but as it is difficult to determine the exact point at which the action is completed, a few drops of a solution of yellow potassium chromate, the indicator, are added. As soon as the hydrochloric acid is entirely precipitated as silver chloride, the silver nitrate attacks the indicator, producing a faint, blood-red tinge, an evidence that all the chlorine has entered into combination with the silver, and that the slight excess has formed the silver chromate. Indicators are also used to determine, by change of color, the precise point at which a liquid ceases to be either acid or alkaline. The chief reagents used as indicators are yellow potassium chromate, potassium ferrocyanide, indigo, carmine, litmus, turmeric, Porrier's orange, tropæolin, phenolphthalein, eosin, rosolic acid, &c.

† *Cycle of indiction*:

1. *Calendar*: A period of fifteen years, not founded on any astronomical occurrence, but fixed first by Constantine the Great as a fiscal arrangement. It began on January 1, A. D. 313. The Popes adopted it in the year 1582, when the Calendar was reformed,

that year being the tenth of the indiction. The year of the indiction corresponding to any year of our era is thus found: Add 3 to the date, divide the sum by 15, and the remainder is the year of the indiction, the remainder 0 indicating the fifteenth of the cycle. Thus $\frac{1884+3}{15}=125$, with a remainder

of 12. Twelve, therefore, is the indiction of that year. There are three other indictions besides Constantine's: the Cæsarean or Imperial, the Roman or Pontifical, and that of the Parliaments of France.
